Introduction

Quintette Mine's first trainload
of steelmaking coal in 24 years

Our Reporting Approach

This report was prepared to disclose material sustainability topics for Conuma Resources (Conuma) for the calendar and financial year from January to December 2024, in alignment with the December 2023 Coal Mining Sustainability Accounting Standards Board (SASB) standards and in alignment with the Taskforce on Climate-Related Financial Disclosures (TCFD). Conuma's Climate Change reporting is integrated into this Sustainability Report. The Board approved the contents of this report in a meeting of Directors held on March 18, 2025.

The release of the International Sustainability Standards Board (ISSB) S1 and S2 standards marks a significant step in global sustainability disclosure. In December 2024, the Canadian Sustainability Standards Board (CSSB) released the Canadian Sustainability Disclosure Standards (CSDS), aligning ISSB standards with Canada's unique context. The CSSB's release of the CSDS followed an extensive public consultation process with stakeholders across Canada, ensuring the standards address the country's specific regulatory, economic, and environmental needs. In line with Canadian reporting requirements, Conuma plans to adopt these standards for the financial year ending in 2026, ensuring compliance with evolving regulations. Additionally, Conuma continues to evaluate the Global Reporting Initiative (GRI) and the European Sustainability Reporting Standards (ESRS) for potential future reporting, as may be necessary, to meet stakeholder governance expectations and regulatory requirements.

In September 2023, the Taskforce on Nature-related Financial Disclosures (TNFD) framework was released, marking a significant step forward in integrating nature-related risks and opportunities into financial reporting. Since then, the framework has gained traction across industries, including mining, although its adoption remains in the early stages of development. Conuma continues to evaluate the TNFD framework and its relevance to our sustainability initiatives. We have begun exploring its scope and potential application, laying the groundwork for incorporating these disclosures into our future reporting practices as use of the framework evolves.

Loading of the first train at Quintette Mine

About Conuma Resources

Conuma is a leading producer and supplier of steelmaking coal to the global steel manufacturing industry. With our operations centered in Northeast British Columbia (NEBC), Canada, we excel in delivering high-quality steelmaking coal to many of the world’s leading steelmakers.

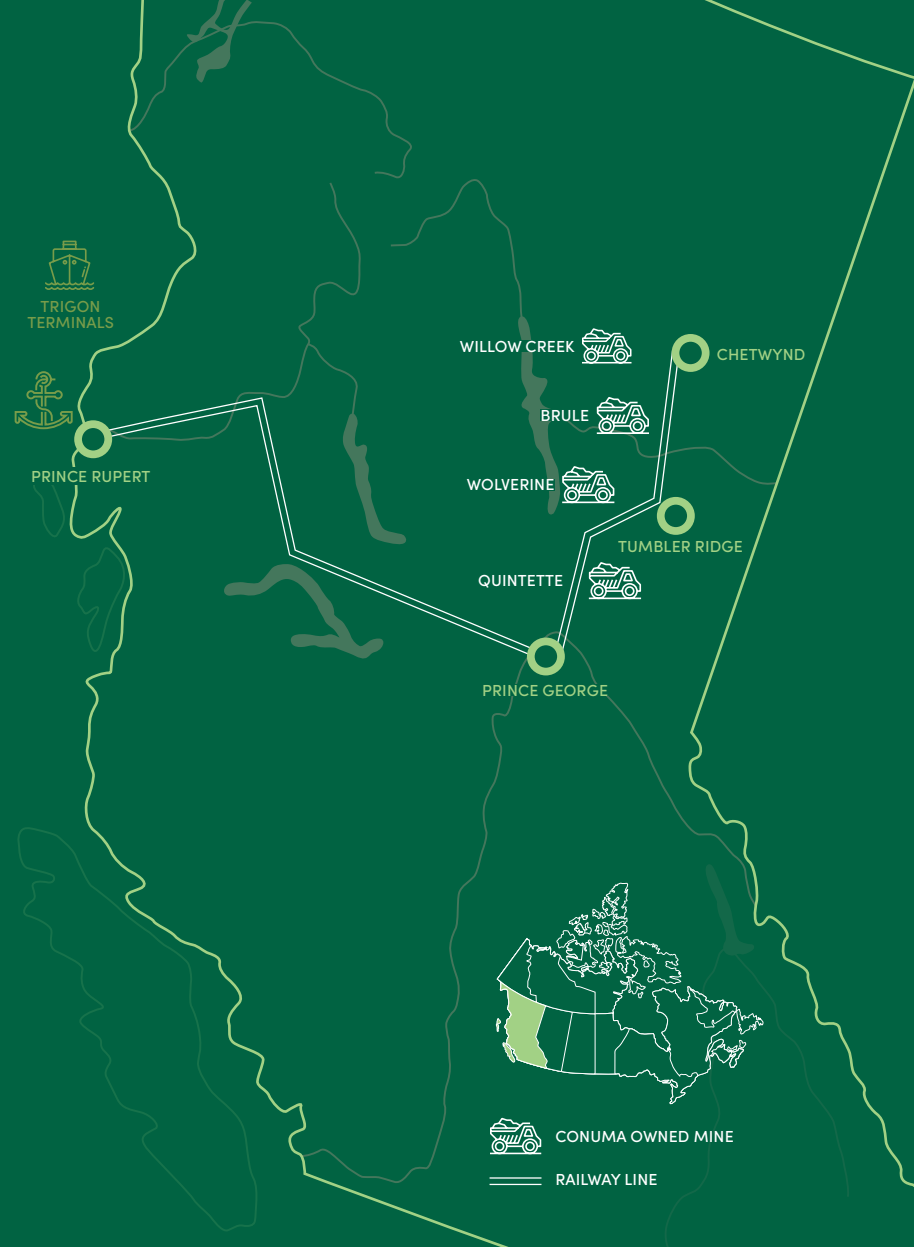

Founded in 2016, we have grown to become the second largest mining operator in British Columbia (BC), Canada, with over 1,000 employees and an annual production capacity of over five million tonnes of steelmaking coal.

Our mission is to operate safely and grow our steelmaking coal business to create sustainable value for our shareholders, employees, customers, business partners, Indigenous Nations, communities, and the environment in which we operate.

In 2024, Conuma had four open-pit mines operating at different times of the year. Willow Creek Mine operated for the entire year. Wolverine Mine operated until May 2024, when it closed, having mined out all its open-pit reserves in April 2024. Brule Mine operated until December 2024, and will move into care and maintenance in 2025. Quintette Mine, acquired from Teck Resources in 2023, started production in September 2024, following receipt of the Little Windy permit.

Conuma’s operations support over 1,000 direct jobs and generate over 3,000 indirect employment opportunities across BC and Canada. Additionally, we work with over 20 Indigenous vendors and 150 regional suppliers in the Peace River Regional District, contributing to local economic development.

We focus on producing premium hard coking coal (HCC) and high-carbon content coal for pulverized coal injection (PCI) processes, which are essential materials for steelmaking rather than power generation. Our products are supplied to markets in Asia, South America, and Europe, backed by some of the world’s highest-quality steelmaking coal reserves located in NEBC. With a robust marketing and logistics network, we deliver a consistent, cost-effective, and low-emission-intensity supply to our global customers.

AT A GLANCE

Quintette Mine: A New Beginning
Restarted after 24 years following significant investment and modernization, now poised for decades of sustainable production.

Willow Creek Growth: Work underway to extend mine life from 2029 to 2035.

Acquired Peace River Coal in February 2025: Adding Trend-Roman to boost future output.

Community-Driven Success: Strong relationships with Treaty 8 Nations and local communities.

Brian Sullivan
Chief Executive Officer

Chief Executive Officer Report
A TRANSFORMATIONAL YEAR

2024 was a transformational year for Conuma, marked by significant milestones and strategic developments. Quintette Mine commenced operations, Wolverine Mine closed after exhausting its mineable open pit reserves, and Brule Mine finished mining within its permitted boundary. After 24 years of care and maintenance, Quintette Mine’s return to production was a landmark achievement for Conuma and Tumbler Ridge, initially established in the early 1980’s to support this mine. Revitalizing this large, first-tier mining operation was the most ambitious undertaking in Conuma’s history, requiring 1.5 million working hours and, at peak times, more than 500 personnel on site, including both employees and contractors.

Restarting Quintette Mine was the most ambitious undertaking in Conuma’s history.

The modernization and recommissioning of Quintette Mine have established it as a top-tier operation poised for decades of responsible production. Key milestones included rebuilding the first of four processing plant modules, completing the 5.2-kilometre overland gravity-fed conveyor, and substantial investments in mining equipment. The commissioning of the second plant module upgrade in February 2025 doubled its capacity, enabling it to handle the full raw coal production from the mine’s current pits.

Meanwhile, our Willow Creek Mine operation continued to deliver safe, efficient, and low-cost production. We have also initiated work on the Willow Creek Mine South project, which, once permitted, will extend the mine’s life from 2029 to 2035.

Conuma’s growth and the successful commissioning of Quintette Mine would not have been possible without the steadfast support and collaboration of local communities and regional Treaty 8 Indigenous Nations. We deeply value the trust placed in us by these partners and remain committed to fostering reconciliation, building meaningful relationships, and ensuring our operations deliver long-term benefits. We recognize the privilege of stewarding these extraordinary natural resources and remain dedicated to developing them responsibly, with sustainability, community prosperity, and environmental stewardship at the forefront of our efforts.

We recognize the privilege of stewarding these extraordinary natural resources and remain dedicated to developing them responsibly.

In February 2025, we acquired the Peace River Coal (PRC) business from Anglo American plc. The acquisition includes the Trend-Roman mine, which has been in care and maintenance since 2014. Located adjacent to Quintette Mine, Roman represents a high-quality, low-strip-ratio steelmaking coal opportunity. This strategic addition allows us to leverage the Quintette Mine processing plant to efficiently process coal from the site, further enhancing our operational capabilities and production potential.

The political and regulatory landscapes continue to evolve both regionally and internationally, influencing the future of steelmaking and resource development. While proponents of green steel continue to advocate for alternatives, the cost and time to meaningful production for these technologies remain significant hurdles. This reality underscores the enduring necessity of steelmaking coal as a critical input to global steel production to support the energy transition, securing its role for decades to come. Conuma remains committed to meeting this essential demand responsibly while aligning with sustainability goals.

Navigating the significant changes of 2024 while maintaining an outstanding safety record was no small feat.

Navigating the significant changes that Conuma experienced in 2024 while maintaining an outstanding safety record was no small feat. I extend my heartfelt gratitude to all Conuma employees, the Indigenous Nations and communities we collaborate with, and the numerous contractors and suppliers who supported us throughout this journey. Through these collective efforts, we can proudly reflect on a transformational year that has positioned Conuma for a promising and sustainable future.

Brian Sullivan
Chief Executive Officer

AT A GLANCE

Safety First: Achieved zero lost time injuries at Quintette, and Willow Creek Mines.

Indigenous Spending: Indigenous businesses completed \$188M of work for Conuma in 2024.

Carbon Cuts: Piloted 10M litres of renewable diesel and commissioned Quintette’s overland conveyor.

Water Leadership: Strong water stewardship. New Brule water treatment plant to treat six million litres daily.

Methane Milestone: BC Regulators approved a 50% lower methane emission factor for two Conuma mines.

Hugh Kendrick
Chief Sustainability Officer

Chief Sustainability Officer Report

A YEAR OF SAFETY EXCELLENCE & MEANINGFUL CLIMATE ACTION

Sustainability remains at the core of Conuma’s operations, and 2024 marked another year of significant progress. This is our third year of reporting under the SASB framework, and our fourth year aligned with the TCFD. Over the past year, we achieved meaningful advancements across environmental, social, and governance (ESG) priorities, including significant progress in reducing our carbon intensity.

In 2024, we achieved a lost-time frequency rate five times lower than the mining industry average across BC.

Safety remains our foremost core value. We concluded 2024 with two lost-time incidents, achieving a lost-time injury frequency rate (LTIFR) that is one fifth of the average for the mining industry across BC. Our Willow Creek Mine operation maintained an exemplary safety record, achieving zero lost-time injuries (LTIs) over more than one million hours worked. At the close of 2024, we proudly reported zero LTIs since acquiring Quintette Mine in February 2023—a remarkable achievement given the more than 1.8 million hours dedicated to replacing and refurbishing legacy infrastructure, constructing, commissioning, and commencing operations for the new mine. This milestone showcases our commitment to safety, made possible by the exceptional focus and collaboration of our leadership, employees, and partners.

In 2024, we further expanded our community engagement efforts, consistently interacting with Indigenous Nations and municipalities and supporting many events across our communities. Regional spending exceeded \$237 million, including \$188 million with Indigenous-owned or affiliated businesses—more than double our 2023 expenditure and quadruple that of 2022. These partnerships underscore our dedication to fostering meaningful and lasting benefits for Indigenous Nations and local communities.

Regional spending exceeded \$237 million, including \$188 million with Indigenous-owned or affiliated businesses.

Concerning climate change, in the summer of 2024, we piloted the use of 10 million litres of renewable diesel, which has one-quarter the carbon intensity of conventional petroleum diesel. In December, we commissioned the Quintette Mine 5.2 km overland conveyor, eliminating the need for several haul trucks. After two years of rigorous, science-based research conducted by Conuma, the BC Government approved our proposed methane emission factor for Willow Creek and Brule Mines in August 2024, cutting it in half. This reflects the significantly lower fugitive methane emissions in the Peace Region and enhances the accuracy of our environmental reporting.

Over the past five years, we have significantly enhanced our water stewardship efforts, driven by substantial investments, particularly at Brule Mine. In 2024, we completed the construction of a full-scale Moving Bed Biofilm Reactor (MBBR) at Brule, capable of treating up to six million litres of mine water daily before safe environmental discharge.

We remain focused on minimizing environmental impacts through responsible mining, progressive reclamation, and innovative water and wildlife management.

We remain focused on minimizing environmental impacts through responsible mining, reclamation, and innovative water and wildlife management. By embracing leading practices, we aim to balance profitability with our responsibilities to employees, Indigenous Nations, and the communities we serve. Conuma is dedicated to building trust, accountability, and lasting partnerships as we advance our sustainability efforts. Our vision is to ensure our operations deliver value today and leave a positive legacy for future generations.

Hugh Kendrick

Our Sustainability Mission

Willow Creek Mine

Sustainability Statement

Sustainability drives our strategic vision as a leading supplier of steelmaking coal, a critical component in the low-carbon economy and the global transition to renewable energy. The steel produced with our coal underpins global progress, including developing and distributing renewable power infrastructure.

We prioritize responsible production, striving to create lasting value for the communities we serve while offering meaningful opportunities to employees, Indigenous Nations, and local partners. Our commitment to environmental stewardship is equally integral, with operations adhering to rigorous compliance standards. The goals of our reclamation practices are:

- Restoring land capability to pre-disturbance conditions
- Rebuilding self-sustaining forested ecosystems that support local wildlife
- Integrating Traditional Knowledge from Indigenous Nation partners into land use and restoration planning

Our success depends on partnerships—with employees, customers, and suppliers—working together as a cohesive, respectful team. We strive for a diverse and inclusive workforce where everyone contributes to our shared success.

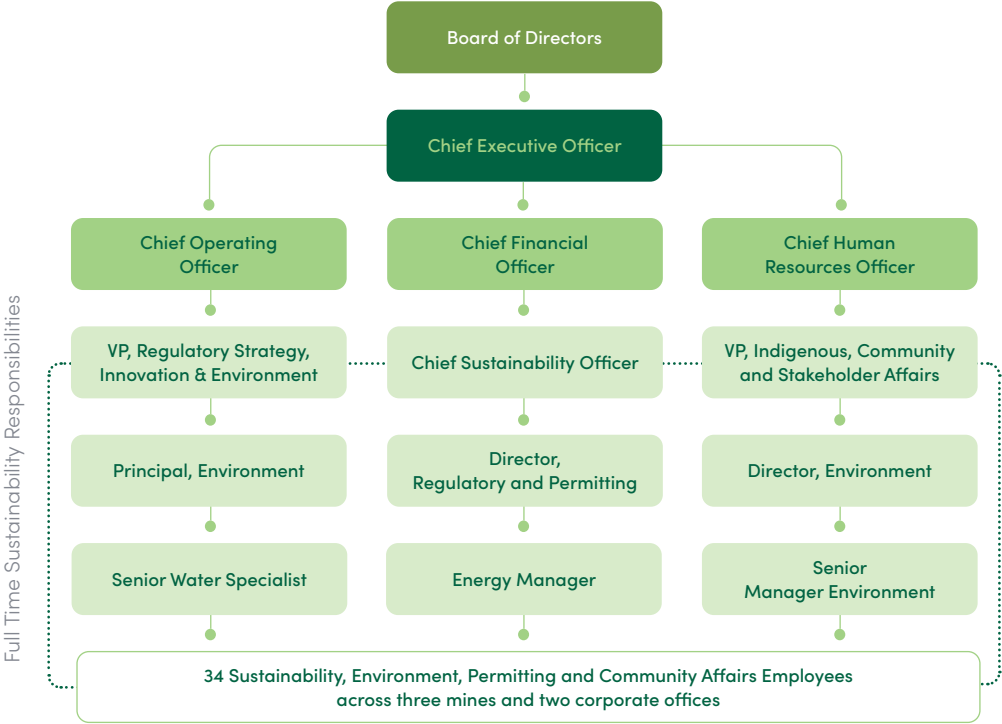

Safety and efficiency remain at the heart of our operations. By fostering a healthy, injury-free workplace, we ensure the responsible and effective production of steelmaking coal to meet the needs of today's evolving world.

The following page outlines our Sustainability Governance and Climate Change Business Integration frameworks.

FROM PIT TO PORT: INTEGRATING ESG AT EVERY STAGE OF THE MINE LIFE CYCLE

SUSTAINABILITY GOVERNANCE AND LEADERSHIP STRUCTURE

CLIMATE-CHANGE BUSINESS INTEGRATION

Climate Change Governance and Responsibilities

Board of Director Responsibilities

- ✓ Ensure Senior Management focuses on climate-related risk management
- ✓ Ensure short, medium and long-term focus
- ✓ Ensure all critical planning and strategic processes integrate climate-related risk management
- ✓ Meet bi-annually specifically to review climate-related risk
- ✓ Appoint one Director to take the lead on climate-related risk management matters
- ✓ Ensure Senior Management transparently and consistently reports climate-related risks and opportunities to investors and key stakeholders
- ✓ Commit to education and staying current on climate-related risks

Senior Management Responsibilities

- ✓ Ensure climate-related risk informs strategic and decision-making processes
- ✓ Integrate climate-related risk into the budget and operating cycle planning – short, medium and long-term
- ✓ Develop procedures to consider climate-related risk in all business processes and systems
- ✓ Meet bi-annually with the Board to specifically review climate-related risks and opportunities
- ✓ Meet bi-monthly to review climate-related risks and opportunities
- ✓ Ensure that climate-related risks, opportunities and strategic decisions are consistently and transparently disclosed to the Board and stakeholders
- ✓ Establish a Climate Change Committee
- ✓ Include relevant climate-related risk disclosures in the annual MD&A filings
- ✓ Commit to education and staying current on climate-related risk
- ✓ Use the best available information and expertise to manage climate-related risk
- ✓ Recruit and retain sufficiently skilled senior climate-related risk management team

Our Senior Leadership Team

2024 in Review

As a leading supplier of steelmaking coal and Canada's second-largest producer, we focus on achieving operational excellence across our existing mines while actively assessing opportunities within our portfolio. Our approach to sustainability emphasizes securing, permitting, and efficiently managing cost-effective reserves to ensure long-term success.

In 2024, our safety performance across all operations was outstanding, achieving an LTIFR of 0.12 and a Total Recordable Injury Frequency Rate (TRIFR) of 1.16. Our LTIFR improved again, decreasing by 25% compared with the already low rate of the previous year, while our TRIFR was slightly higher than last year's performance. To put these achievements into perspective, Conuma's 2024 LTIFR and TRIFR were 80% and 21% lower, respectively, than the industry average for mining operations in BC, as reported by the Mining Association of British Columbia (MABC).

The first two mines Conuma started operating in 2016, Wolverine Mine and Brule Mine, closed in 2024. Wolverine Mine closed in May 2024, having exhausted

its surface mining resource. Brule Mine finished mining out its permitted areas in December 2024 and will go into care and maintenance in 2025.

Quintette Mine's revival—18 months, 1.5 million hours, and a major infrastructure overhaul—positions it for high-capacity steelmaking coal production.

Quintette Mine, acquired from Teck Resources in February 2023, produced and shipped its first steelmaking coal in September 2024. The reconstruction of Quintette Mine encompassed 18 months and more than 1.5 million hours of work, resulting in a refurbished first module of the processing plant, including the replacement of the old thermal dryer with a mechanical dewatering circuit, the construction of the 5.2 km overland conveyor, and the acquisition and transfer of a complete mining fleet for the mine. With more than 48 million tonnes of low ratio clean steelmaking coal reserves and significant infrastructure and processing capacity, Quintette Mine has the potential to produce at

much higher levels than Wolverine Mine and Brule Mines.

Willow Creek Mine has also significantly expanded over the last two years, with a production rate of more than four times the rate when it was brought back into production at the end of 2020.

Accounting for the wind-down of mining operations at Wolverine Mine and Brule Mine during 2024 and the later-than-expected start of Quintette Mine due in part to delays in receiving a mining permit, annual production in 2024 of 3.9 million tonnes was 25% below 2023. By the end of 2024, however, Quintette Mine had reached the processing plant's first module nameplate capacity of 500 tonnes per hour throughput.

The acquisition of PRC from Anglo American plc in February 2025 also adds significant HCC production capacity that can be processed through the Quintette Mine facility.

The Northern Lights seen above Brule Mine in October 2024

2024 Sustainability Highlights

Our Conuma Core Values

Our business and the way we operate are founded on our core values:

Safety

We are accountable and disciplined to eliminate safety risks.

Growth

We invest in quality, efficiency and innovation to create a profitable and predictable future.

One Conuma Strong

We are productive, resilient and enthusiastic problem solvers, working as a team to deliver outstanding results.

Heart

We choose to be professional, respectful, and inclusive.

Sustainability

We operate today and plan tomorrow in a way that sustains the health of our employees, business partners, community, and environment.

Materiality Assessment

This sustainability report was prepared after completing a materiality assessment update, which identified and evaluated the material sustainability topics our business deals with the most. The materiality assessment process we utilized in 2024 included analysis and review of subjects and timing for reporting by our senior management team. The studies also included engagement with external parties, such as our financial advisors, to confirm that the topics we had identified were relevant to investors and lenders and to ascertain if there were additional topics on which we needed to report.

Utilizing feedback from the materiality process and aligning with the SASB Coal Standard, the 2024 reporting topics selected were:

Workforce Health & Safety

- Safety
- Crisis Management
- Occupational Health

Climate Change

- Strategy
- Energy
- Emissions and Intensity

Tailings Management

Water Management

Air Quality Management

Waste Management

Biodiversity

- Metal Leaching and Acid Rock Drainage
- Reclamation

Social Relations

- Labour Relations and Human Rights
- Relationships with Indigenous Nations

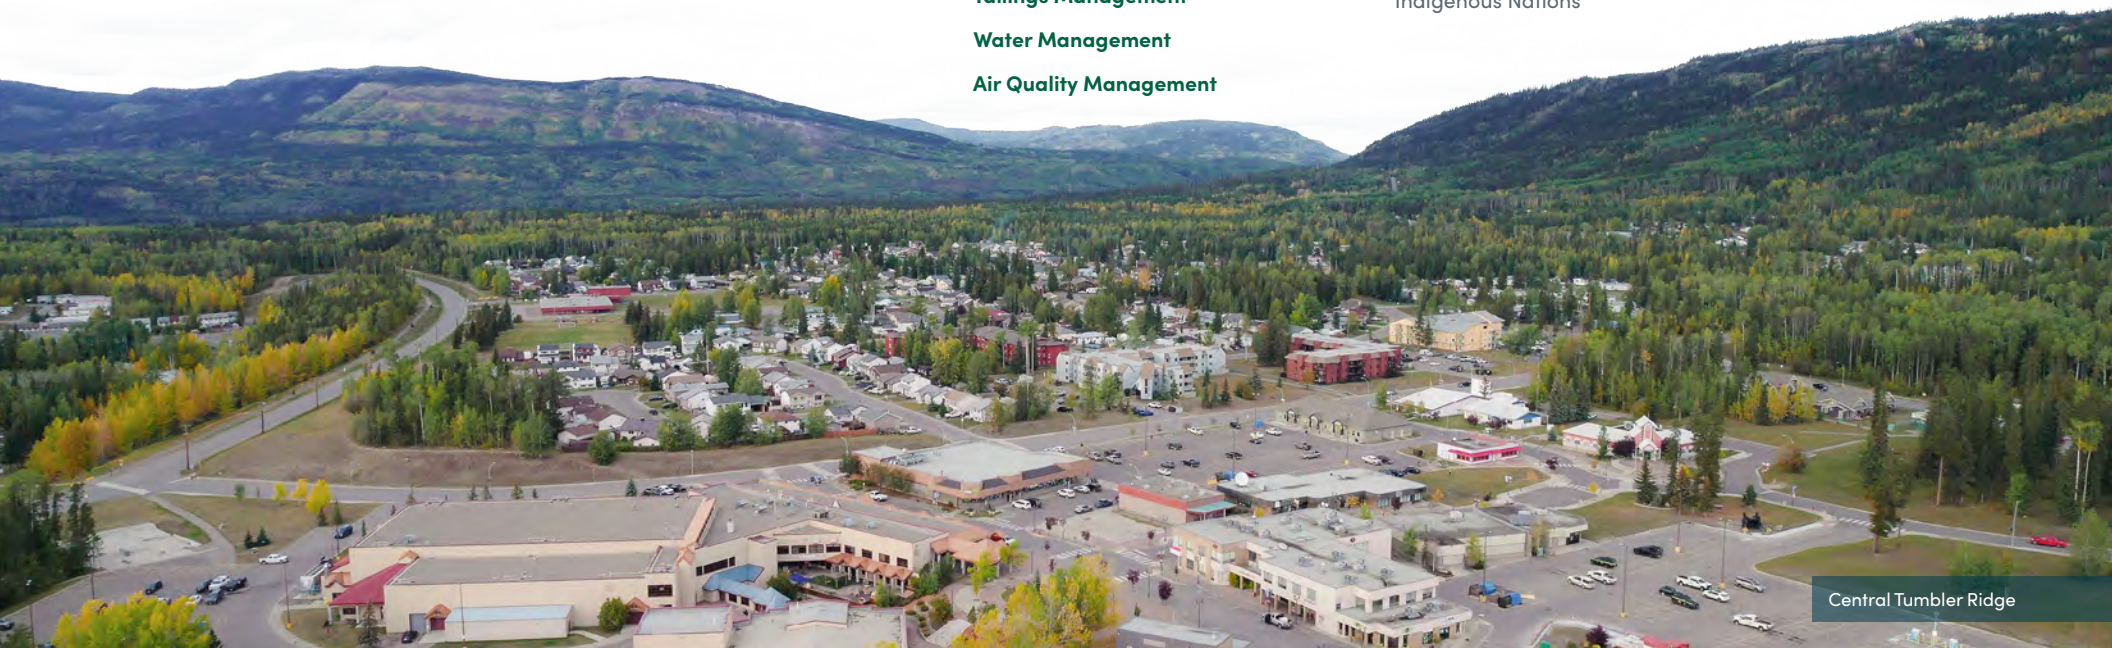

Community Relationships

- Employee Development

Business Ethics and Code of Conduct

Responsible Sourcing

Cybersecurity and Artificial Intelligence

Central Tumbler Ridge

Workforce Health & Safety

Chocking the rear tire of a rubber tire dozer

At Conuma Resources, the health and safety of our workforce is our most fundamental and uncompromising core value. Our robust management practices prioritize physical and mental well-being, ensuring a secure environment for employees, contractors, and the communities we serve. Safety is a shared responsibility, with everyone accountable for their actions and empowered to refuse unsafe work. Guided by the principle that all incidents are preventable, we continuously improve our policies, investigate all incidents thoroughly, and maintain a high level of emergency preparedness. Together, we are committed to fostering a culture where safety is integral to every decision and action.

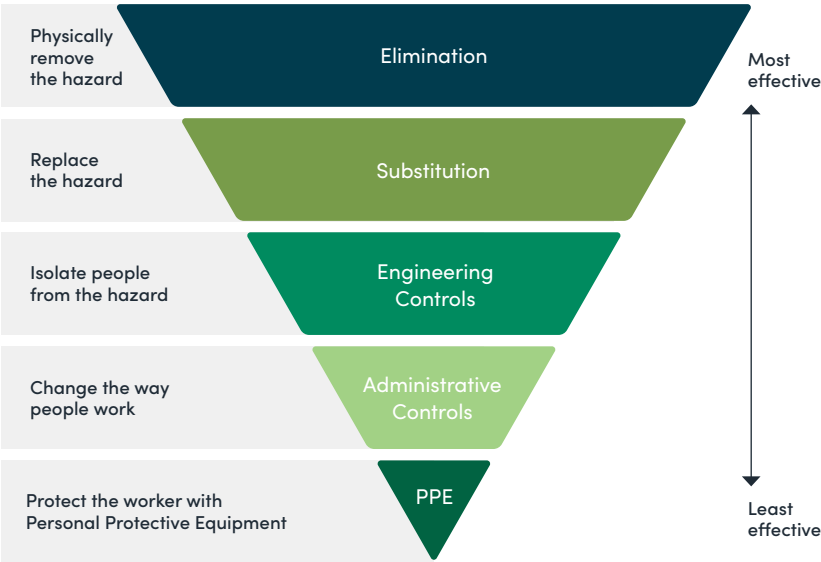

Safety

Safety is a cornerstone of our operations and a shared commitment among our management, employees, and contractors. We believe a healthy and safe work environment is a fundamental right for all, and working safely is a non-negotiable employment requirement.

Commitments

- We will ensure that all employees are trained to work safely, recognize and understand hazards in their workplace, and actively participate in controlling the risks.
 - Every individual is responsible and accountable for their own safety and the safety of their colleagues.
 - Employees and contractors have the right to refuse unsafe work and challenge unsafe procedures.
 - Continuous improvement in our safety program is essential to eliminate complacency and mitigate risks.
 - We investigate all incidents thoroughly and ensure that we use the learnings therefrom to prevent future occurrences.
 - We uphold a high standard of emergency preparedness.
- Safety is more than a priority at Conuma — it is a core value that informs every aspect of our operations. Together, we strive to create an environment where everyone goes home safely every day.

HIERARCHY OF CONTROLS

Life Saving Rules

Our Eight Life Saving Rules are a cornerstone of our safety program. They are designed to address the most serious workplace hazards and prevent serious injuries or fatalities. These rules are mandatory for all employees and contractors, and we have a zero-tolerance policy for failing to comply with them.

Confined Space Entry

Entering enclosed or partially enclosed spaces, not intended or designed for continuous human occupancy.

Working From Heights

Any work performed at a level from which it is possible to sustain an injury from a fall requires fall protection systems.

Line of Fire

Personal awareness of struck-by and caught in-between hazards is critical to maintaining workplace safety.

Mechanical Lifting

All lifting operations must be carefully planned and executed by qualified personnel using certified equipment to prevent accidents.

Energy Isolation

Effective isolation of energy sources, such as electricity and pressure, is essential to safeguard workers from hazardous exposure.

Bypassing Safety Controls

Safety-critical equipment and systems must remain fully operational to ensure the protection of personnel and equipment.

Safe Driving

Drivers and passengers must adhere to safe driving practices, including wearing seatbelts, being aware of their surroundings and maintaining vigilance on the road.

Fit for Duty

Workers must be in a physical and mental condition suitable for their duties and free from the influence of drugs or alcohol.

These rules form the foundation of our safety culture and empower everyone at Conuma to contribute to a safer workplace. By following the Life Saving Rules, together with our other core safety program elements, we work together to protect lives and promote accountability.

Injury-Free Achievements in 2024

- On September 30, 2024, our Willow Creek Mine celebrated one year and one million hours LTI-free. This performance continued through the rest of 2024.
- Wolverine Mine was LTI-free for all of 2024.
- In December, Quintette Mine reached 1.8 million hours LTI-free. The site has not had an LTI since Conuma took ownership in February 2023.

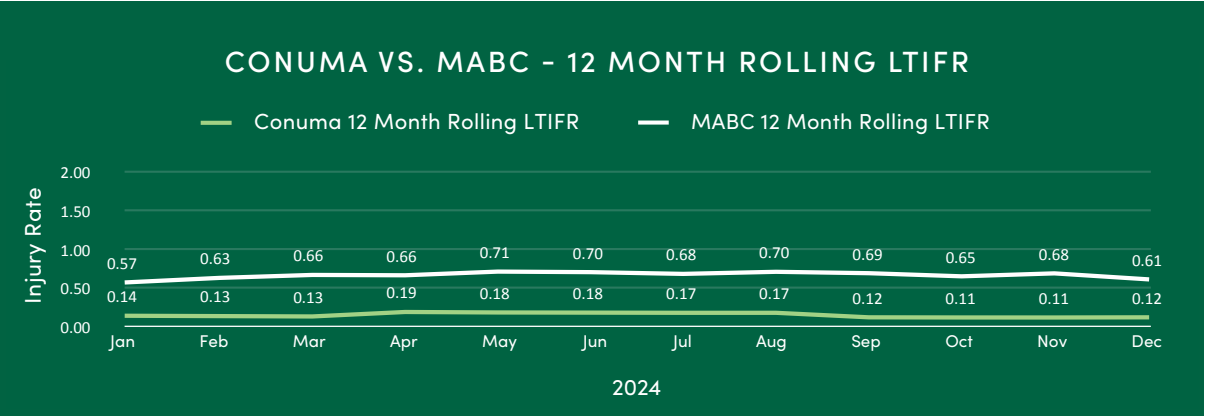

Certificate of Recognition Audit Results:

In 2024, we achieved an exceptional 99% score in our annual Certificate of Recognition (COR) audit, a notable improvement from the 92% score earned during the 2023 audit cycle. The COR program is a nationally recognized standard for occupational health and safety management, demonstrating a company's commitment to maintaining a safe and compliant work environment. The 2024 audit covered comprehensive evaluations across all our active and inactive mine sites, as well as our office facilities in Tumbler Ridge and Vancouver, showcasing our dedication to upholding the highest safety standards across all areas of our operations.

Lifting a large haul truck box

Safety Statistics:

Our injury rates continue to be well below the BC provincial industry average. Compared with rates tracked by the MABC, year over year, we have consistently shown lower TRIFR and LTIFR rates. We ended 2024 with a 12-month TRIFR that was 21% lower than the MABC average and a 12-month LTIFR of 80% below the MABC average. In 2024, we experienced an increase in medical treatment cases compared to 2023, the majority of which were minor incidents occurring during the reconstruction of Quintette Mine.

SAFETY	EMPLOYEES		CONTRACTORS		COMBINED TOTALS			
	MEDICAL TREATMENT	LTI	MEDICAL TREATMENT	LTI	MEDICAL TREATMENT	LTI	TRIFR ³	LTIFR ⁴
2023 ¹	5	2	4	0	9	2	0.87	0.16
2024 ²	10	2	8	0	18	2	1.16	0.12

1 In 2023, 46 dangerous occurrence incidents were reported across the three operations, with no fatalities.

2 In 2024, 52 dangerous occurrence incidents were reported across all four operations, with no fatalities.

3 TRIFR = ((MT + LTI) / person-hours worked per year) normalized against 200,000 person-hours as per MABC practice.

4 LTIFR = (LTI / person-hours worked per year) normalized against 200,000 person-hours as per MABC practice.

SAFETY AWARDS

In April 2024, our Brule Mine won the Edward Prior Award for safety in mining in BC. The Office of the Chief Inspector of Mines, Ministry of Energy, Mines and Low Carbon Innovation, presents this award to operations that logged between 200,000 and 1,000,000 worker hours and had the lowest injury frequency rate. This is the third time Brule Mine has won the award and the sixth time for a Conuma mine since our inception in 2016.

The Brule team receiving the Edward Prior award from BC Minister of Energy, Mines and Low Carbon Innovation, Josie Osbourne

Safety Leadership Training and Development

In late 2023, we launched a comprehensive Safety Leadership training program designed specifically for our frontline supervisors. Since the program's beginning, we have developed a suite of nine training modules to serve as a centralized knowledge hub. This initiative focuses on equipping our leaders with the skills to identify hazards, implement robust controls, and conduct effective incident investigations.

These programs are designed to empower our frontline leaders with the knowledge and tools necessary to keep safety at the forefront of our daily operations, fostering a culture where safety is integral to achieving operational excellence.

Lessons Learned Implementation

In 2024, we introduced a comprehensive “Lessons Learned” initiative across all sites to proactively prevent the recurrence of incidents. To ensure that all sites benefit from the experiences and learnings arising from an incident, this program systematically shares detailed information about the incident, such as root causes and corrective actions taken, with all our operations.

Following an incident, a “Lessons Learned” summary is promptly developed, detailing the incident’s key aspects, including the root cause, critical learnings, and corrective actions. These summaries are then promptly distributed to key personnel across the company and incorporated into the daily toolbox talks with all crews to reinforce awareness and drive continuous improvement in safety practices.

Safety Risk Register Program

We introduced a health and safety risk register program in the fourth quarter of 2024, and it will continue to develop through mid-2025. This program involves preparing Job Hazard Analyses, formal risk assessments, and Safe Job Procedures, with the objective of proactively enhancing operational safety and reducing risks.

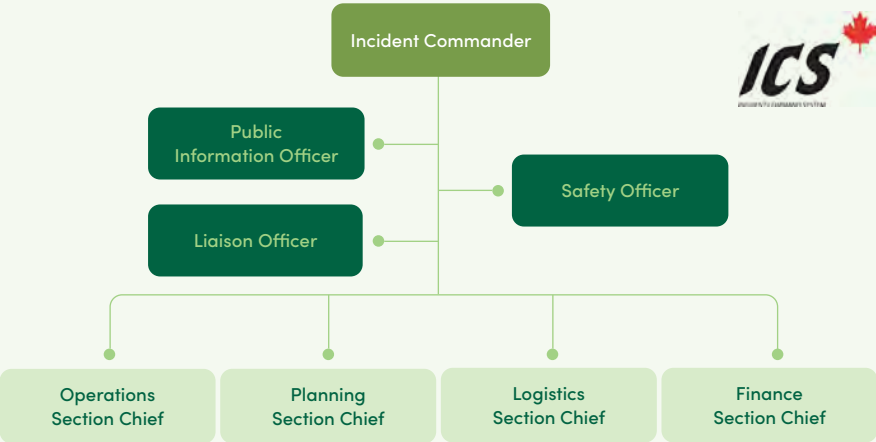

Crisis Management

This year, we trained our key site and corporate leadership personnel in the Incident Command System (ICS). The aim is to improve our ability to respond to critical incidents of all types. ICS is an internationally recognized system for incident response. The benefits of this training include:

- Clearly defined response functions to ensure unified, coordinated roles and responsibilities
- Strengthening our response efficiency and effectiveness
- Mutual aid agreements and alignment of shared resources with local emergency services agencies and neighbouring industries

INCIDENT COMMAND SYSTEM

Mine rescue team extinguishing a fire following lightning striking trees

Mine Rescue

2024 Highlights:

Capacity and Readiness

We significantly enhanced our Mine Rescue program by expanding response capabilities and deploying new equipment across all sites, including fire trucks, wildfire attack units, and structure protection kits. We also upgraded our first responder rescue and safety gear for firefighting, confined space rescue, high-angle rescue, and much more.

From late 2023 through 2024, our team roster more than doubled to 250 trained members across our sites. Over the same period, our retention rate increased to greater than 90%, ensuring a stable complement of well-trained long-term members.

In the last quarter of 2024, we began conducting all mine rescue certification courses in-house, building internal expertise, training capabilities and leadership. This ensures our teams are trained to a high level of skill, and courses are delivered in a timely manner to better serve the needs of our sites.

Operational Milestones

- Established Emergency Operations Centers at each site, significantly improving our response effectiveness for large-scale critical incidents.
- Each site conducted desktop exercises and mock drills to increase our readiness and teamwork.

TRAINING AND COMPETITIONS

Over the past year, we have greatly increased the scope of our training sessions by incorporating advanced slope and high-angle rescue techniques, vehicle extrication, fire pump operations, swift water rescue, and off-site search and rescue.

In April 2024, we conducted our first internal competition, pitting our mines against each other in friendly rivalry. Two mine rescue teams represented Conuma at the provincial competition in June 2024. Our first aid team won the Northern Zone, advancing to the Provincial finals.

In 2025, we will continue to expand our training regimen, acquire new equipment, and build on our collective knowledge and expertise.

Mine Rescue First Aid at the Provincial Competition

AT A GLANCE

Ergonomic Gains: Injury rates down 75% through training and equipment upgrades.

Dust Control: Improved air filtration, suppression, and respiratory protection.

Health Focus: Comprehensive testing for hearing, lung health, and fitness.

Proactive Maintenance: 2,000-hour cab checks ensure safe air quality.

Safer Workspaces: Redesigned areas to reduce fatigue and injury risks.

Occupational Health

Ergonomic Injury Prevention

Over the past two years, we have substantially progressed in reducing ergonomic risk factors, particularly in mobile equipment operations. Our ergonomic injury rate associated with this group has decreased fourfold, attributed to targeted operator training, enhanced haul road preparation, and rigorous vehicle cab configuration and maintenance.

Recognizing the importance of ergonomic injury prevention and its positive impact on our operations and the well-being of our employees, we launched additional initiatives in 2024 to further address priority risk conditions. Key measures included:

- **Work Area and Equipment Redesign:** Projects were launched to redesign the work environment in several areas to reduce manual handling stresses and decrease fatigue and other risk factors associated with musculoskeletal injuries.
- **Ergonomic Assessments:** Health and Safety coordinators and supervisors have increased the frequency and coverage of ergonomic assessments. This proactive approach focuses on using the assessments as leading performance and risk indicators, enabling early identification and mitigation of ergonomic issues and fostering a safer workplace environment.

Industrial Hygiene Monitoring

Building on the success of our updated industrial hygiene monitoring program launched in 2023, we continued expanding efforts in 2024 to address silica, coal dust, and noise exposure in high-risk roles. Our emphasis is on implementing permanent controls wherever elevated risks are identified. Key accomplishments include:

- **Equipment Upgrades:** Baseline sampling was completed at Quintette Mine, focusing on older equipment. Many units have been replaced with models featuring highly efficient air filtration systems, while the remaining older units are being retrofitted with cab pressurization and filtration systems
- **Preventive Maintenance:** Every 2,000 operating hours, our mobile equipment fleet undergoes a cab seal integrity test to identify and repair air leaks that may result in dust ingress, ensuring safe air quality for operators.
- **Dust Control:** Targeted applications of long-term suppressants on permanent mine roads have allowed our Water Buffalo to focus more on high-risk mine areas for repeated treatment. Furthermore, in-situ dust suppression measures (e.g. Rain Bird sprinklers) are installed at high dust areas such as our ROM and clean coal stockpiles.
- **Respiratory Protection:** A Trigger Action Response Plan for respiratory protection has been developed for high-risk personnel and areas, such as pit ground personnel. A new quantitative fit testing program has been implemented, with targeted testing for employees in high-risk roles, including our mine rescue members.

Employee Health and Medical Assessments

In 2024, we partnered with a local clinic to conduct comprehensive medical assessments for new employees. These evaluations include vision, hearing, lung health, and physical fitness tests, ensuring new hires are placed in roles aligned with their health and safety capabilities.

For existing employees, health exams remain a priority. Our occupational nursing partners conduct medical screening exams for hearing loss and lung health (silicosis) on an annual basis. Data from these examinations is integrated with workplace exposure monitoring to evaluate control measure effectiveness and identify areas for improvement.

Key Highlights:

- **Health Screenings:** Onsite audiometric and lung function testing was conducted across all mine sites.
- **Control Effectiveness:** Test outcomes are used to validate current controls' effectiveness and address any identified gaps through targeted remedial actions.

By maintaining a strong focus on occupational health and safety, we continue to enhance the well-being of our workforce and ensure a safer, healthier, and more productive workplace.

Climate Change

Aerial view of Mackenzie BC

Company Strategy

At Conuma, we are dedicated to reducing our carbon intensity progressively. By 2030, we aim to achieve a minimum 15% reduction in our on-site carbon intensity per tonne of steelmaking coal produced, using 2019 as our baseline. Our primary focus is minimizing fossil fuel consumption while actively exploring alternative energy solutions to determine the most effective strategies.

In 2024, our Board of Directors participated in two formal presentations on climate change and received additional information for review and discussion. Additionally, our Climate Change Committee convened four times throughout the year to assess progress on climate-related initiatives and key metrics.

These updates included:

- All climate change-related projects for the Company;
- The Company's very successful pilot program of purchasing and using ten million litres of hydrogenated derived renewable diesel (HDRD);
- The successful program to improve fuel efficiency across all the operations;
- The legislative updates to Canadian and BC fuel and emissions regulations. The most notable change was the implementation of the BC Output Based Pricing Scheme (OBPS) carbon tax in April 2024. The BC Low Carbon Fuel Standard (LCFS) and Canadian Clean Fuel Regulations (CFR) landscapes also continued to evolve;
- The application for and securing of a new BC fugitive methane emission factor for several of the Company's coal mines;
- Conuma's emission intensity compared with global Steelmaking Coal producers (Skarn Associates);
- The significant energy-saving and emission-reducing effects of the new Quintette Mine mechanical dewatering circuits and overland conveyor;
- Carbon intensity reduction option-analysis assessment based on accessible and mature technologies that present realistic and timely emission reduction potential;
- Applications for and the award of several incentive programs relating to emission reductions and energy efficiency opportunities.

Risks and Opportunities

Over the past year, we continued to develop emission reduction strategies, aligning with the principles of the TCFD while preparing for the forthcoming implementation of CSDS 1 and CSDS 2 under the CSSB. This approach ensures we maintain our perspective on risks and opportunities even as the reporting frameworks evolve. Some of these are set out below:

Physical Risks

- Expanded assessment of wildfire impacts, including access to insurance or increased premiums.
- Greater focus on wildfire exposure at mining sites and nearby communities, factoring in historical patterns and vegetation.
- Potential disruptions to renewable fuel supply chains due to climate-related hazards affecting sourcing regions and crop types.

Transition Risks

- Volatility in renewable fuel costs across North America.
- Evolving national and international carbon tax policies impacting the cost of renewable fuel procurement and use.
- Legislative changes affecting operational and compliance requirements.
- Fluctuations in energy pricing and supply, including both fuel and electricity.
- Consideration of workforce attraction and retention challenges linked to climate transition dynamics.

The new overland conveyor at Quintette Mine

Fueling Our Operations

FOCUSING ON FUEL CONSUMPTION

In 2024, we consumed 87 million litres of fuel, 7% less than in 2023. The reduced consumption was principally due to the closure of Wolverine Mine in May 2024, the start-up of Quintette Mine in September 2024, and the scaling down of Brule Mine pending it finishing mining operations in December 2024.

During the year, we continued the program of minimizing unnecessary idling that began in 2023. We also expanded the program to increase operator engagement and education in the operation of the equipment and the efficiencies of operating in the various mining pits. Our equipment telemetric reporting was also improved to highlight equipment on stand-by that might be idling unnecessarily.

In Q4 2024, we installed a new fuel management system to secure and monitor fuel issuance from our mines' fuel installations. This system enhances security by preventing unauthorized fuel use and delivers valuable insights into equipment fuel consumption. In 2025, we plan to enhance our system to track and report fuel usage by individual equipment, enabling better identification and management of assets with unusually high fuel consumption. This initiative will support improved operational efficiency and contribute to optimized fuel usage across our operations.

Refilling the service truck
at Willow Creek Mine

The Carbon Taxation Landscape

Our business is subject to various forms of carbon legislation in BC, including the BC Carbon Tax (BCCT), the OBPS, the LCFS, and the CFR. These evolving policies are designed to reduce greenhouse gas emissions by increasing the cost of fossil fuels and encouraging the adoption of cleaner, renewable alternatives. Currently, pure petroleum diesel purchased in BC incurs an additional cost of approximately 50 cents per litre due to the cumulative impact of these measures. This cost is expected to rise significantly each year as OBPS stringency thresholds tighten and LCFS requirements become increasingly stringent.

We support a carbon tax system that balances meaningful emissions reductions with maintaining the competitiveness of the Canadian steelmaking coal industry. We continue to engage with regulators to ensure transparency in carbon pricing mechanisms and their real-world impact on emissions reductions. The constructive dialogue between the BC Government and industry in 2023 has been encouraging, resulting in practical approaches to carbon legislation. While electrification is advancing, large-scale adoption in mining remains years away. Although electric excavation and drilling equipment are available, most diesel usage in surface mines comes from large haul trucks.

Battery-powered electric haul trucks are not expected until 2028, with widespread adoption likely delayed until the mid-2030s due to production constraints and their 10+ year lifespan. Hydrogen-powered haul trucks also promise to reduce emissions. However, challenges such as scaling green hydrogen production, building refuelling infrastructure, and addressing storage requirements must be overcome. Additionally, to support both electric and hydrogen solutions, substantial increases in electricity generation, hydrogen production, and distribution infrastructure will be critical to meeting the energy demands of future mining operations.

Haul trucks in operation at Quintette Mine

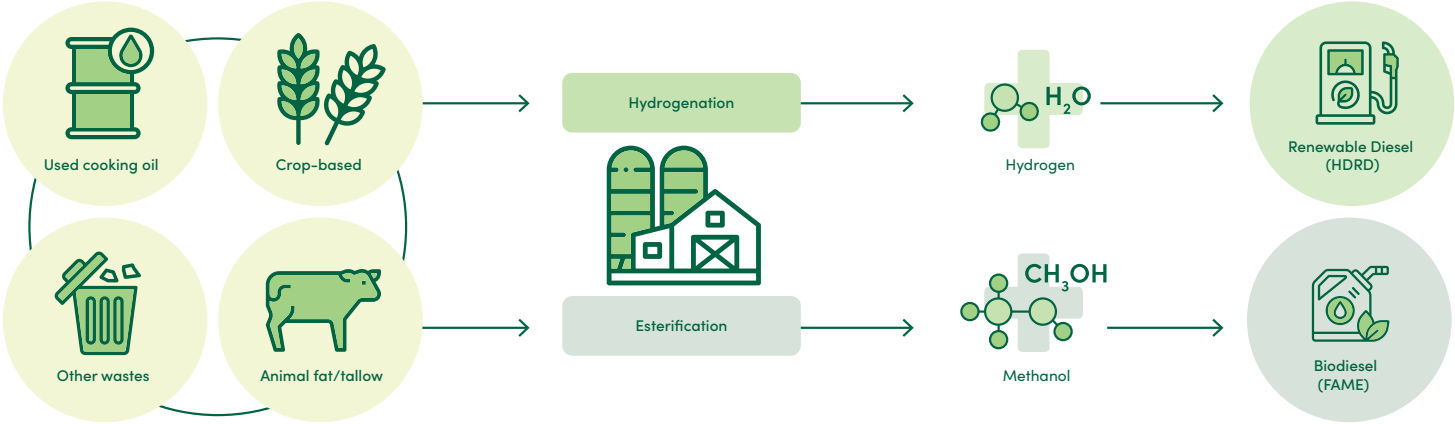

Renewable Diesel

The best short-term opportunity to reduce greenhouse gases is sourcing and using renewable diesel, also referred to as hydrogenated-derived renewable diesel (HDRD). HDRD is a biogenic fuel that integrates hydrogen with organic materials such as vegetable oils and animal fats, resulting in a high-quality, lower-emission alternative to traditional petroleum diesel. Unlike fatty acid methyl ester (FAME) biodiesel, HDRD is fully compatible with existing diesel engines and infrastructure, offers superior cold-weather performance, and has a longer shelf life—making it better suited for the demanding conditions of mining operations. We continue to work with suppliers and equipment manufacturers to address the challenges with HDRD, which include supply, functionality at frigid temperatures, and procurement costs.

In 2024, we successfully completed a pilot program utilizing 10 million litres of HDRD, a renewable diesel with a carbon intensity just one-quarter that of conventional BC petroleum diesel. While the initial rollout encountered some challenges—specifically, microbial growth in delivery system tanks leading to equipment filter blockages—we swiftly identified and addressed the issue. The problem arose due to HDRD's more potent solvent properties, which dislodged existing residues in the system. After thoroughly cleaning the tanks and enhancing filtration, operations resumed smoothly, with HDRD powering our equipment through September without further issues. The program achieved an estimated emission reduction of more than 20,000 tonnes of CO₂e.

Encouraged by the pilot's success and subject to pricing, we plan to expand HDRD use in 2025. With an average annual diesel procurement of over 80 million litres and a rapidly evolving renewable fuel and carbon taxation landscape in North America, the future of lower-carbon fuel sourcing presents both challenges and opportunities to Conuma. We are committed to thoughtfully navigating this complex landscape, balancing operational needs with environmental responsibility to reduce carbon intensity and drive meaningful sustainable progress.

THE PRODUCTION JOURNEY OF RENEWABLE DIESEL (HDRD) AND BIODIESEL (FAME)

Electrical Energy and Energy Efficiency

We are actively engaging with various mining and industrial forums to help educate and support other large Canadian fuel users on the opportunities and challenges of adopting HDRD. Drawing on our experiences and insights from the past two years, we have been sharing our knowledge to help industry stakeholders collaboratively reduce emissions while prioritizing safety, cost efficiency, and minimizing business impacts.

In 2024, we took further steps to advance our energy efficiency, implementing a three-year strategic energy management plan in collaboration with BC Hydro. This plan establishes clear action steps and deliverables, supported by internal and external accountability to ensure progress.

Through a BC Hydro-sponsored Energy Management Assessment, we evaluated energy practices across four key areas: Business, Process, People, and Technology. This assessment provided baseline and targeted scores and identified our top 12 top priorities to guide our efforts, focusing on impactful initiatives to optimize energy use and reduce emissions.

Key milestones included forming an Energy Committee to oversee energy strategy and projects and completing two BC Hydro-funded energy studies at Quintette Mine. These studies confirmed the significant energy savings and emission reductions from replacing the natural gas-powered dryers with all-electric dewatering systems and installing a 5.2 km overland

gravity-fed conveyor. These efforts reflect our commitment to minimizing environmental impact and achieving long-term energy efficiency.

The level of power supply into Quintette Mine also enables us to assess the feasibility of transitioning to electric shovels and production drills in the future, which have the potential to reduce emissions and lower operating costs.

The Governments of Canada and BC, along with BC Hydro, offer a range of incentive

programs designed to support Industry in achieving emissions reduction and energy efficiency goals. These programs provide critical financial support to drive innovation, improve operational sustainability, and accelerate the transition to low-carbon technologies.

In 2024, we successfully secured funding through two different incentive programs. BC Hydro approved an incentive for the Quintette Mine overland conveyor project, recognizing its energy efficiency and

potential to reduce emissions significantly. Additionally, we were successful in our application for additional climate-change funding for two mechanical dewatering modules at Quintette Mine, which will substantially reduce emissions over the mine's lifetime. These achievements underscore our commitment to leveraging resources to drive impactful energy-saving and climate initiatives.

The new 5.2 km gravity fed overland conveyor at Quintette Mine

AT A GLANCE

- Carbon Intensity Reduction Goal:** Targeting a 15% reduction by 2030 in on-site carbon intensity per tonne of steelmaking coal (2019 baseline).
- Renewable Diesel Success:** Piloted 10M litres of HDRD, achieving an estimated reduction of more than 20,000 tonnes of CO₂e and achieving smooth operations after early challenges.
- Energy Efficiency Milestones:** Replacing natural gas dryers with electric dewatering systems at Quintette Mine, and completing a 5.2 km gravity-fed conveyor.
- Methane Breakthrough:** Secured a 50% reduction in the methane emission factor for Brule and Willow Creek, reflecting globally low methane levels in Peace Region coal.
- Industry Leadership:** Ranked among the lowest carbon intensity producers globally due to efficient operations, low methane emissions, and 98% renewable electricity supply.

Relative Emission Intensities and Fugitive Methane

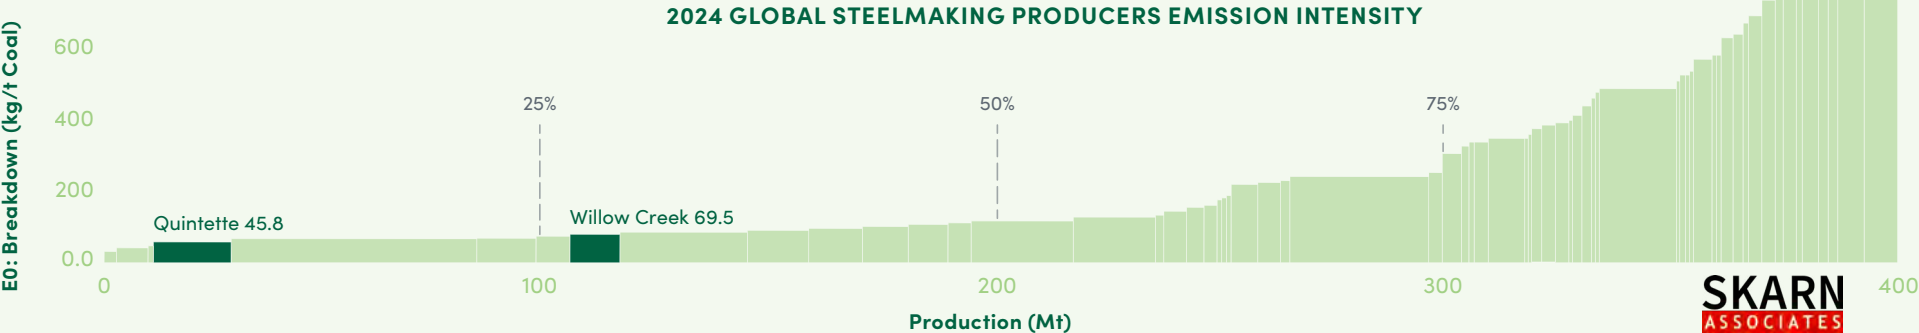

Mining industry emission intensity curves have had much focus over the last few years. These charts depict how mining companies compare with other producers concerning total emissions produced per tonne of material sold into global markets. Skarn Associates produces a carbon intensity curve for steelmaking coal producers, as shown below. One of the essential things to note from the chart is that “fugitive methane” makes up most of the emissions for steelmaking coal producers in the top half of the curve. Coal deposits in the Peace Region have some of the lowest methane levels of any deposits globally. This, combined with our efficient mining operations, logistical proximity to significant customers, and electricity supply which is 98% renewable, defines Conuma as a premier low-carbon intensity supplier in the steelmaking industry.

Under current legislation, our mining operations must calculate emissions using a provincially mandated fugitive

methane emission factor. Historically, this methodology has attributed 30% to 40% of our total Scope 1 emissions to fugitive methane. However, based on our extensive operational experience, we believe this factor significantly overstates our actual emissions, as coal deposits in the Peace Region are known to contain some of the lowest methane levels globally.

In May 2024, we applied to BC’s greenhouse gas (GHG) regulators to reduce our reportable fugitive methane emission factor from 0.93 kg of methane per tonne of coal produced to 0.47 kg, following an in-depth research initiative led by leading experts in BC. In August 2024, the regulators approved and published a revised methane emission factor for our Brule and Willow Creek operations.

Building on this progress, we plan to continue our research efforts in 2025 to make a similar application for our Quintette Mine.

GHG Data

Diesel fuel is our primary fuel source and is consumed principally in mining activities such as mining and transporting mined overburden and steelmaking coal. Total diesel consumption makes up around two-thirds of our CO₂e emissions.

Most of the electricity we purchase is consumed in our processing plants and maintenance workshops. As reported by BC Hydro, over 98% of the electricity supplied to our operations is generated from renewable sources, meaning that our Scope 2 emissions are near zero.

As noted earlier in this report, the total volume of material mined (coal and overburden combined) in 2024 was lower than in 2023. This was the principal reason that 2024 emissions were lower than in previous years.

SCOPE 1 AND 2 EMISSIONS

METRIC	WOLVERINE MINE			WILLOW CREEK			BRULE MINE			QUINTETTE	TOTAL

Total Scope 1 emissions adjusted for CI (kt CO ₂ e) ³		110.27	113.05	24.47	72.73	82.37	86.52	118.28	110.89	68.73	78.30	301.28	306.31	258.03
Electrical Consumption (GJ)		73,750	87,369	61,917	92,924	90,488	78,555	19,413	18,718	16,802	65,503	186,088	196,575	222,777
Scope 2 Emissions (kt CO ₂ e)		0.236	0.274	0.167	0.297	0.284	0.212	0.062	0.059	0.045	0.176	0.594	0.617	0.600

- 1 In Canada's National Inventory Report (NIR), the default emission factor for open-pit bituminous coal operations in BC is 0.93 kg of methane (CH₄) per tonne of coal mined. Following Conuma's application in May 2024, the BC GHG regulators amended the fugitive methane factor for Willow Creek and Brule mines to 0.47 kg CH₄ per tonne of coal mined, in August 2024. Due to the proximity and similar coal characteristics, Conuma has also applied the 0.47 kg CH₄ per tonne factor to its Wolverine and Quintette operations. The methane emissions data for all mines in 2022 and 2023 have been restated to reflect this revised factor.
- 2 Note 2: BC's LCFS mandates annual carbon intensity (CI) reductions in fuels through 2030. This adjustment reflects both the net CI reduction under the LCFS and Conuma's increased use of biogenic fuels, primarily renewable diesel and biodiesel, which have significantly lower CIs than petroleum diesel—often less than one-quarter. These combined adjustments account for the emissions reductions associated with lower-carbon fuels, contributing to a decrease in site-based Scope 1 emissions.
- 3 Total site-based emissions reflect Scope 1 calculations, adjusted for the inclusion of biogenic fuels, and following the LCFS methodology. The LCFS reductions are based on government-approved emissions factors and are not the result of operational emissions reductions alone. The incorporation of lower-carbon-intensity fuels, such as renewable diesel and biodiesel, has been accounted for in the emissions reporting to more accurately represent Conuma's GHG reduction efforts.
- 4 The Scope 1 emissions presented in this report are subject to external verification as required under British Columbia and Canadian reporting regulations.

SCOPE 3 EMISSIONS

- 1 CN calculated the 2024 emissions saved as over 218 kt of CO₂e by moving our product by rail rather than trucking.
- 2 Increased engagement with vendors has improved the accuracy of Scope 3 emissions for 2023 reporting for Conuma.
- 3 The total volume of material mined (coal and overburden combined) in 2024 was lower than in 2023, which is the principal reason 2024 Scope 3 emissions were lower than in 2023.
- 4 Represents U.S. environmental impacts comparing “gate-to-gate” remanufacturing and manufacturing processes for engines and components. Based on a 2018 external study of Caterpillar® engines, alternators, and turbochargers. Does not include impacts elsewhere in our value chain. Reference from [Caterpillar® website](#)

One of Conuma's haul trucks undergoing a rebuild

EXTENDING EQUIPMENT LIFE THROUGH REMANUFACTURING

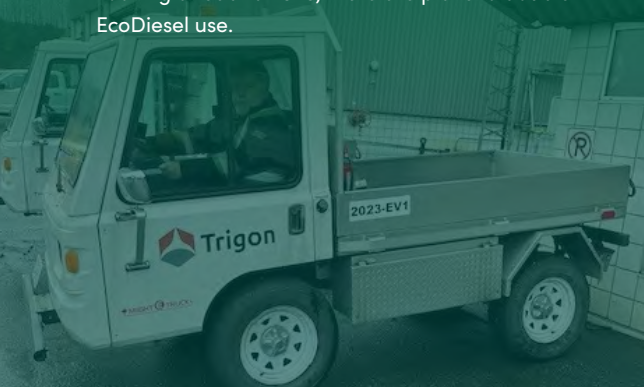

Conuma has partnered with Finning Canada, the world's largest Caterpillar dealer, to extend equipment lifecycles and reduce waste through remanufacturing. This process involves disassembling, reconditioning, and updating components to restore like-new performance while lowering environmental impact. Caterpillar equipment is designed for multiple lifecycles, reducing raw material use, energy, and water consumption. Remanufacturing cuts GHG emissions by 65–87%⁴ compared to new manufacturing. In 2024, Finning rebuilt 24 machines for Conuma, with similar numbers expected in 2025, reinforcing both companies' commitment to sustainability and operational efficiency.

TRIGON TERMINALS GREEN MARINE PROGRAM

Trigon has been a member of the Green Marine program since 2012 and it is the only terminal that has landed a perfect score on all seven indicators two years in a row.

The Trigon team’s passion for managing and reducing the terminal’s impact on the environment – to minimize its environmental footprint and reduce its greenhouse gas emission – is evident in the various environmental initiatives and undertaking over the years. Community engagement, reducing fuel consumption, or waste reduction and recycling have been in the front and centre.

Some recent examples: Trigon is actively engaged in the community and seeks regular feedback and guidance from Indigenous communities. In addition to the no idling policy, the Trigon team was notably able to reduce the diesel consumption since 2022 and trialed the use of EcoDiesel in 2024. Looking ahead to 2025, there are plans to double EcoDiesel use.

Responsible Sourcing

In 2024, we expanded our responsible sourcing strategy by engaging directly with nine of our top ten vendors: Suncor Energy Inc., Canadian National Railway (CN), Trigon Pacific Terminals Ltd., Finning International Inc., SMS Equipment Inc., Wajax Corporation, Orica Canada Inc., Fountain Tire, and WMFN Industrial Metalworks Ltd. These meetings, held in the second half of the year, went beyond typical seller-buyer relationships by including subject matter experts and completing in-depth discussions on many critical sustainability topics.

This approach facilitated meaningful discussions and established deeper connection points across our respective organizations. These efforts are not only vital within our organization but also aim to extend our reach and influence by encouraging our vendors to target even higher sustainability goals and standards and challenging ourselves to meet their expectations in return. These meetings will continue annually to foster collaboration, learn from each other, and create joint accountability.

As part of our commitment to ethical business practices, all vendor contracts include provisions addressing bribery and corruption, while relevant contracts also incorporate requirements related to anti-slavery, child labour, and compliance with Bill S-211. In May 2024, we published our 2023 report under the Fighting Against Forced Labour and Child Labour in Supply Chains Act, outlining our efforts to uphold these standards across our operations and supply chain.

Key focus areas reviewed with major vendors:

Health and Safety – reviewing trends in lag and leading safety indicators, shared initiatives to improve safety, and discussed programs supporting employee wellness.

Decarbonization – sharing progress on emissions reduction targets, trials, and strategies for managing Scope 1 and Scope 3 emissions.

Local Indigenous Nation Engagement – highlighting reconciliation efforts, equity participation, commercial partnerships, and employment opportunities

Community Engagement – discussing local employment statistics, community support initiatives, and charitable contributions.

Diversity and Inclusion – reviewing progress on inclusion goals, challenges, and the role of employee resource groups.

Ethical Sourcing – confirming compliance efforts for Bill S-211 and processes ensuring supplier adherence to ethical standards.

Waste Management – focusing on recycling targets, hazardous waste management, and strategies for reducing packaging waste.

These collaborative engagements showcased our vendors' alignment with our values and sustainability goals. By incorporating subject matter experts and fostering deeper connections, we have laid the groundwork for a stronger, more integrated supply chain. These efforts are pivotal in supporting operational needs and our broader sustainability objectives.

Environmental

Quintette Mine processing
plant and rail loadout

Our three tailings storage facilities (TSFs) are managed with multiple layers of oversight to ensure safety, environmental compliance, and operational excellence. This includes an internal Qualified Person, an external Engineer of Record (EOR), an Independent Tailings Review Board (ITRB), and corporate and regulatory supervision. Skilled operators and technical staff continuously monitor and manage the facilities in alignment with the mine's Tailings Management System (TMS).

Oversight and Inspections:

Regular third-party evaluations are fundamental to maintaining the integrity of the TSFs. These include annual dam safety inspections, a five-year independent Dam Safety Review (DSR), and annual ITRB assessments. Weekly inspections by site engineering and operational staff, monthly evaluations by a designated Qualified Person, and a yearly inspection and safety report prepared by the EOR provide an additional layer of assurance. Our TSFs comply with BC's Health, Safety, and Reclamation Code for Mines and adhere to industry best practices, upholding the highest safety standards.

Tailings Management System:

Each facility is governed by a TMS consolidating operational procedures, monitoring systems, and improvement initiatives. This strategy supports a structured approach to identifying and implementing ongoing improvements. Comprehensive monitoring programs include instrumentation to confirm geotechnical design parameters, visual monitoring, periodic inspections, and compaction monitoring to ensure performance and integrity.

Monitoring and Reporting:

Monitoring results are documented in the Annual Dam Safety Inspection Reports and are tracked through a quarterly performance monitoring program managed by the EOR. Any practical improvements identified by the EOR or employees through monitoring and reporting are tracked for implementation to enhance facility safety and effectiveness.

Emergency Response Planning:

Emergency Response Plans have been developed for the TSFs and are integrated into the broader Mine Emergency Response Plans. These plans focus on the potential impacts of a TSF failure, initial response steps, coordinated recovery efforts, and employee training. Desktop studies and mock drills conducted by mine rescue coordinators ensure preparedness and refine response protocols. Regular employee training emphasizes swift and effective action in an unlikely emergency.

Tailings Management

Safely managing processed mineral residue, commonly called “tailings,” is a cornerstone of responsible mining operations. Our highest priority is ensuring all our TSFs consistently exceed legislative safety and environmental standards.

We maintain and operate one TSF at our Wolverine Mine and two TSFs at Quintette Mine.

PERIOD	TAILINGS STORAGE FACILITIES			
	WOLVERINE	BRULE	WILLOW CREEK	QUINTETTE
2016–2024 existing	1	0	0	2
Active care	1	0	0	1
Operations	1	0	0	1

Wolverine Mine Tailings Facility

The Wolverine Mine TSF, initially constructed in 2005, captures tailings piped from the adjacent Wolverine Mine Processing Plant and pumps clarified water back for recycling through the Processing Plant. In May 2024, the adjacent Perry Creek Pit reserves were exhausted, and Wolverine Mine transitioned to care and maintenance. The processing plant has been idled since July 2024. Although no tailings are currently being deposited in the Wolverine Mine TSF, it is still operated, maintained by our employees, and supported by an EOR. A closure and reclamation plan for the TSF is in place, including long-term monitoring and maintenance of the facility to ensure stability and prevent any impacts on the regional communities or environment.

The next five-year DSR for the Wolverine Mine TSF is scheduled for inspection in 2025, with the report to follow in 2026. The ITRB will evaluate this review to ensure comprehensive oversight.

Quintette Mine Tailings Facilities

Quintette Mine operated between 1982 and 2001, after which it went into extended care and maintenance. Following its acquisition from Teck in February 2023, the mine and processing plant were recommissioned, and it started operating in September 2024. Quintette Mine has two TSFs: the Plant Site Tailings Facility (PSTF) and the Shikano North Tailings Facility (SNTF).

The PSTF, located within Quintette Mine approximately 2.2 km north of the coal processing plant and administration building, is a horseshoe-shaped dam spanning 2,600 meters. Originally constructed to store coal tailings, the facility has been inactive since 1997 and was maintained by Teck Resources until its acquisition by Conuma in February 2023. The PSTF is in the care and maintenance phase, involving proactive monitoring and management to ensure its safety and compliance with environmental and regulatory standards.

The SNTF is located within Quintette Mine and retains tailings via the Shikano North Tailings Dam (SNTD), a cross-valley rockfill structure built across the mined-out Shikano North Pit. Tailings deposition commenced in September 2024 with the recommissioning of the Quintette Mine processing plant, marking the SNTD's transition to operational status. A downstream water capture system, well-established below the SNTD, collects water and recycles it back to the Quintette Mine processing plant, supporting efficient resource utilization and environmental stewardship.

To innovate safe and sustainable mining practices, we have pledged to implement the Global Industry Standard on Tailings Management (GISTM) for our Quintette Mine TSFs. GISTM, published in 2020 by the International Council on Mining and Metals, sets out a framework for prioritizing safety throughout the life of a TSF, including design, operation, closure, and post-closure. We are progressively aligning the two TSFs at Quintette Mine with the GISTM framework. Some of the work completed to date includes appointing a qualified EOR, Ecora Engineering & Environmental, for both facilities in 2023, establishing an ITRB for the TSFs, including holding an annual meeting and completing a site visit. The TMS for these facilities will continue to be refined throughout 2025.

AT A GLANCE

Safeguarding Tailings: Prioritizing Safety and Sustainability.

Facilities Managed: One TSF at Wolverine Mine, two at Quintette Mine, all exceeding safety and environmental standards.

Robust Oversight: Regular inspections by Qualified Persons, Engineers of Record, and independent reviews.

Emergency Ready: Tailings-specific response plans with regular training and drills.

Robust Practices: Quintette TSFs to align with GISTM.

Recycling: Recycling water from tailings supports efficiency and environmental stewardship.

Why It Matters: Ensuring safe, sustainable tailings management is key to protecting communities, the environment, and operational excellence.

AT A GLANCE

Safeguarding Tailings: Prioritizing Safety and Sustainability

Integrated Approach: Managing water quality and quantity risks at the watershed level from construction to closure.

Low-Risk Operations: All sites classified as low-risk using the World Resources Institute's Aqueduct Water Risk Atlas.

Advanced Tools: Piloted the Flux Forecast tool for extreme weather event warnings up to 7 days in advance.

Recycling Success: Quintette Mine implemented water recycling systems, with Willow Creek using 100% recycled water for coal processing.

Biochemical Reactors: Treated over six million litres daily at Brule Mine, significantly reducing contaminants.

Active Water Treatment: Trial active water treatment plant at Brule Mine, achieved 99% nitrate removal and over 90% selenium reduction.

MBBR Construction: Completed construction of 6 million-litre per day capacity MBBR by year-end, enhancing water treatment capacity and efficiency.

Saturated Rock Fill Research: Advanced hydrogeological and biogeochemical studies to enhance future water treatment solutions.

Blasting Technology: Improved blasting processes with electronic detonation to reduce nitrates and enhance precision and safety.

Reclamation Efforts: Revegetated 12 hectares, reducing infiltration and improving water management.

Water Management

Water is critically important to our business, Indigenous Nations, and the communities we serve. Our integrated water management approach manages potential water quality and quantity risks at the watershed level throughout the mining lifecycle from construction to closure. We continuously progress water stewardship by measuring performance against our objectives, engaging stakeholders, and implementing adaptive management practices to address challenges and opportunities.

We assess water risks in our operating catchments using the World Resources Institute's Aqueduct Water Risk Atlas v. 4.0. This tool employs a composite index approach with 13 indicators covering various water risk types. As of 2024, all Conuma operations are situated in watersheds classified as low-risk—the lowest risk threshold in the tool.

In 2024, we piloted the Flux Forecast tool, an advanced warning system for extreme weather events. This tool integrates weather forecasts and landscape features to provide up to seven days' advance warning of extreme precipitation and snowmelt events. We leverage this information to proactively manage operations during freshet and improve risk management processes, including inspection and maintenance scheduling.

This year, we updated our water and water quality management plans to reflect best practices and revised water balance and water quality models where necessary to support adaptive water management strategies. We also implemented

mining practices to reduce contaminant levels, integrating these learnings into the Quintette Mine plan. Strategies include improved stockpiling, non-contact water diversion, and enhanced blasting techniques. In 2024, we successfully revegetated 12 hectares of previously disturbed land at the Hermann early works site. Reclaimed land is critical in reducing infiltration, enhancing evapotranspiration and reducing the volume of surface water that becomes contact water. By limiting water infiltration, less water interacts with waste rock materials. This minimizes the generation of contact water, reducing the burden on water management and treatment systems.

Per the conditions of our water licences issued under the Water Sustainability Act, we use surface and groundwater primarily for coal processing, site dust control, and some equipment cooling. Our steelmaking coal retains some water as essential moisture to ensure safe and environmentally responsible transportation by rail and ship to our customers.

Key focus areas in 2024 included identifying and implementing water recycling opportunities across our operations and water planning for Quintette Mine. New recycling initiatives at Quintette Mine include collection systems near the TSF, supported by infrastructure to pump water back to the processing plant. Additionally, processing makeup water is sourced preferentially from the flooded Shikano Pit before utilizing freshwater. At Willow Creek Mine, all coal processing in 2024 was supported with 100% recycled water. Water was recycled from Pit number 4 to the North Pond to support operations, reducing potential freshwater from the Pine River by over 180 million litres.

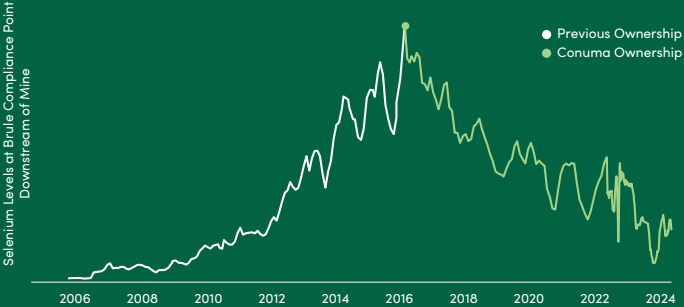

We operate under provincial authorization permits updated through regular engagement on mine plan changes. These permits detail the environmental monitoring requirements and site-specific water quality objectives. Monitoring occasionally shows elevated levels of limited metals, nitrates, and sulphates, particularly during low-flow periods. However, trends for critical parameters like selenium have remained stable or decreased during our ownership of Brule Mine, even in periods of nominal flow.

We regularly monitor environmental effects and, over the last two years, completed additional regional research on selenium bioaccumulation to ensure that the parameters of concern do not have adverse environmental effects. Selenium is a required micronutrient for fish but can have detrimental effects at higher tissue concentrations.

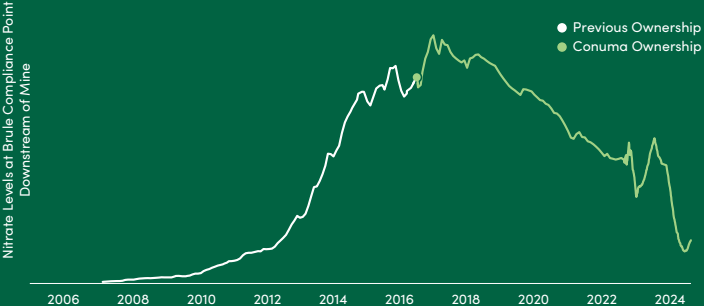

These controlled experiments assess selenium uptake from water to algae, and relationships between selenium tissue concentrations in algae and benthic invertebrates to fish tissue. The experimental results aligned closely with regional selenium bioaccumulation models developed from field-based data, validating their use in setting site-specific thresholds for selenium in water and aquatic tissues.

In 2024, we invested significantly in water treatment infrastructure to enhance regulatory compliance and environmental stewardship. We designed and constructed a six million litre per day active water treatment facility at Brule Mine. The design of the water treatment facility was based on process design and insights from our pilot-scale water treatment system. This system has consistently achieved 99% nitrate removal and over 90% selenate reduction. Utilizing a moving bed of biofilm reactors and ultrafiltration, this facility combines biological, chemical, and physical processes to denitrify and convert soluble selenium into insoluble elemental forms. Elemental particulate selenium is subsequently removed from the water via ultrafiltration before discharge. Capable of treating over two billion litres annually, the plant reached commissioning readiness by year-end.

SELENIUM TRENDS AT BRULE MINE

NITRATE TRENDS AT BRULE MINE

The North Brule Mine Pit will be used as a reservoir to supply the water treatment plant. This reservoir serves dual purposes. First, it effectively mitigates seasonal water supply deficits, ensuring uninterrupted year-round operation. Second, it enables the storage and treatment of nearly all contact water generated on-site.

During the year, we also significantly advanced research on our Saturated Rock Fill water treatment system at Brule Mine by focusing on two key areas: hydrogeological investigations and biogeochemistry. We used tracer studies to analyze water flow pathways and the environmental fate of water, including the stability and transformation of contaminants. These advancements in hydrogeological dynamics and site-specific biogeochemistry provide critical insights that will inform the design and implementation of a future pilot-scale study.

As a further element of our water management strategy, we operate two Biochemical Reactors (BCRs) at Brule Mine. A BCR is an energy-efficient, engineered system designed to remove parameters of concern from contact water through biological reactions. Each BCR consists of a lined basin filled with a substrate mixture of hay, sawdust, wood chips, and a top layer of hay for insulation. Naturally occurring microbes within the substrate drive the reduction-oxidation reactions that

remove nitrate and selenium. The microbes utilize carbon from the substrate for growth, creating an anoxic environment that facilitates nitrate reduction to nitrogen gas and transforms soluble selenium (selenate or selenite) into less soluble forms, such as elemental selenium. These immobilized selenium species adsorb onto the substrate or precipitate within the system. Together, the two BCRs treat over six million litres of water daily, reducing nitrate and selenium levels by an average of 50% or more.

We are taking additional measures to mitigate contaminant levels, including different mining practices at the current operations and integrating these learnings into the Quintette Mine plan. These include strategies related to material stockpiling practices, non-contact water diversion, and improvements in blasting techniques.

In 2024, we continued utilizing the electronic detonation technology introduced in 2023 to enhance our blasting processes. This advanced technology improves blasting precision and control while also reducing the presence of nitrates in the blasted rock material, which is ultimately disposed of onsite. Additionally, electronic detonators enhance safety and efficiency by detecting and communicating potential misfires before the blast occurs, helping to mitigate risks and optimize operations.

The newly constructed MBBR at Brule Mine

Air Quality Management

Monitoring air quality is essential to protecting the respiratory health of our workforce and nearby communities and preserving ecosystem health. Due to our operations' remote locations, the potential impacts from dust are less significant compared to other environmental factors. Nevertheless, dust management practices defined in our site-specific Air Quality and Fugitive Dust Management Plans are still implemented to help control the total volumes of dust created by our operations.

Throughout 2024, our dust management practices continued to focus on the following measures:

- Enhanced dust suppression efforts across all sites, utilizing water trucks, road suppressants, and rain birds at processing plant stockpiles.
- Mechanical dust control methods, including using baghouses at plants and semi-enclosed conveyors or transfer points.
- Strict maintenance and enforcement of speed limits across operations to minimize dust mobilization.
- The application of suppressants to loaded train cars to reduce dust emissions during coal transportation.
- Reclamation of areas no longer required for mining, reducing their exposure to wind and further mitigating dust.

Dustfall canisters, which provide high-level data on dust volumes, have been deployed across all four operating sites. Seven locations between the Wolverine Mine and Willow Creek Mine processing plants conduct annual emission stack monitoring. Quintette Mine also has several monitoring sites which have been including in the annual emission monitoring program.

Willow Creek Mine monitors particulate matter (“PM”) sizes of 2.5 and 10 due to its proximity to the highway and some residential properties. The new 24-hour monitoring station is impacted by wildfires in the region which results highly variable results.

Trend-Roman Mine is currently in care and maintenance, it also utilizes dustfall canisters and conducts PM monitoring of sizes 2.5 and 10 is in place at the industrial park 1 km northeast of the its rail load-out site.

Water truck at Willow Creek Mine

Waste Management

Managing waste materials effectively is critical to operational efficiency and environmental responsibility. This includes all waste categories, such as tailings, waste rock, hydrocarbons, and metals.

We have established comprehensive procedures to manage and track on-site and off-site waste volumes. These procedures focus on maximizing the practical use of waste, such as recycling tailings water for processing or repurposing waste rock for land forming and reclamation. Other waste products, including general materials like wood, cardboard, metal, and hydrocarbons, are recycled through licensed contractors to ensure proper lifecycle management and compliance with environmental standards.

At Brule Mine, hazardous waste management was enhanced by installing a gated hazardous waste storage area, implementing a gate key sign-out procedure to ensure compliance, and introducing labelled tags for waste containers to prevent mixing and facilitate appropriate disposal methods.

Willow Creek Mine took further steps by introducing daily inspections by environmental technicians, exceeding the required weekly and monthly checks. These inspections ensure continuous monitoring, efficient garbage removal from laydowns, and responsive adjustments to waste management needs at maintenance sites.

In 2024, we introduced a consolidated waste handling and tracking service to further strengthen waste management practices across all our sites. This initiative included modernized waste bins designed for flexibility and efficiency, supporting increased recycling rates and overall waste reduction. These efforts reflect our commitment to proactive, lifecycle-focused waste management, ensuring the best diversion pathways for each material while aligning with site compliance objectives.

The Quintette Mine and Trend-Roman Mines have general waste landfills with Refuse Permits. Using these on-site landfills reduces general waste transportation costs and greenhouse gas emissions.

There were 27 spills of hazardous material (i.e., mine contact water, hydraulic oil, engine oil, diesel, or coolant) from equipment malfunctions across the four operations reported to the Provincial Environmental Emergency Program as per the Environmental Management Act, matching the 27 similar spills in 2023 from three operations. All spills were sufficiently cleaned, and the material was removed from the site using bins designated for contaminated waste.

PILOTING TIRE RECYCLING

In December 2024, we took the significant step of recycling our first six large off-the-road (OTR) tires in partnership with Fountain Tire and National Tire Recycling Group (NTRG).

The tires were processed at NTRG's Ponoka facility using a multi-stage mechanical process that removes tread and sidewall rubber before sectioning the remaining structure. This method avoids hazardous shredding or heat-based techniques, ensuring a safer and more sustainable outcome.

By diverting these large tires from stockpiling, we reduce fire hazards, free up site space, and mitigate environmental risks. Each load is tracked through a Chain of Custody system, with a Certificate of Destruction issued upon completion.

This successful pilot paves the way for ongoing OTR tire recycling at Conuma.

The first six OTRs leaving Quintette Mine to be recycled

EARTH DAY GARBAGE CLEAN-UP

On April 22, 2024, we organized a Tumbler Ridge community Earth Day garbage pick-up initiative. Nearly 50 Conuma employees, contractors, and public volunteers helped pick up garbage in the ditches from the Flatbed Falls Parking Lot to Quintette Mine. The team collected a 20-yard bin worth of garbage and 15 bags of recycling.

Throughout the year, our sites frequently dedicate time and resources to site-wide clean-ups where numerous departments participate to keep our sites clean.

YEAR	GENERAL WASTE (t) ¹		HAZARDOUS WASTE (t)		SCRAP METAL (t)

Biodiversity

Operating within BC’s biodiverse and species-rich landscapes provides us with a breathtaking natural setting but also a profound responsibility to protect the ecosystems that sustain this biodiversity.

We are deeply committed to ensuring that our operations meet or exceed the environmental management expectations of rightsholders, stakeholders and regulatory authorities. To address the increasing complexity of regulations and permit requirements, we have enhanced our internal compliance tracking systems across all sites as part of our Environmental Management System (EMS).

Each site operates under a comprehensive suite of management plans within the EMS, covering key areas such as wildlife conservation, vegetation management, soil preservation, and reclamation. These plans proactively identify potential risks and establish mitigation strategies to minimize environmental impacts.

Our commitment to transparency is reflected in our environmental performance reporting, including provincially mandated permits like the Annual Reclamation Report, which is publicly available. This ensures accountability while demonstrating our efforts to balance operational excellence with environmental stewardship.

Metal Leaching and Acid Rock Drainage

Our properties are located within the Gates and Gething coal formations, intersecting various stratigraphic units with a low but potential risk of Metal Leaching and Acid Rock Drainage (ML/ARD). We proactively manage and mitigate these risks through comprehensive ML/ARD management plans and standard operating procedures, regularly updated by qualified experts based on site-specific data.

Our monitoring program covers all associated materials, including coarse coal rejects, tailings, waste rock, and pit surfaces, ensuring effective management practices that minimize environmental impacts. At our Quintette Mine operation, we remain vigilant in addressing ML/ARD risks, employing advanced and proactive strategies to mitigate the potential effects of on-site materials.

Reclamation

Our mining activities are recognized as temporary use of the land, and we take responsibility for restoring the entire site to meet its intended end-use goals once production concludes. Reclamation is integral to our process, beginning from the initial stages of designing and planning our mining operations.

We maintain detailed five-year mining plans and comprehensive Reclamation and Closure Plans for each facility. These plans, approved by the BC Ministry of Mining and Critical Minerals (MCM), include cost estimates for all outlined activities. To ensure accountability, MCM collects a security reclamation bond.

Our reclamation efforts include reshaping waste dumps, applying topsoil, and planting native vegetation to establish forest cover and forage areas that benefit both wildlife and traditional Indigenous practices.

We contract local Indigenous-owned businesses to support and execute reclamation activities. These partnerships extend from re-sloping to the placement of topsoil and revegetation. Twin Sisters Native Plants Nursery, based in Moberly Lake, has collected area-specific seeds, plants, shrubs, and trees to ensure we use the appropriate native plants are used in reclamation.

In 2024, we continued to monitor previously reclaimed areas for vegetation success and metal uptake. We completed final revegetation activities at the Hermann early works site and planted over 36,000 native trees, shrubs and forb species. Wolverine Mine, which completed its

mining activities in May 2024, has over 400 hectares of land available for reclamation. As an essential contribution to the Quintette Mine Caribou Conservation Plan, we have committed to reclaiming available areas at Wolverine Mine over the next five to seven years. Our other priorities for 2025 include further developing the reclamation monitoring program and trials to improve soil quality and vegetation take-up success.

At Brule Mine, our comprehensive reclamation plan integrates both planning and execution phases with site-wide water management to achieve a holistic result. In parallel, we are conducting an amendment feasibility study to identify potential soil amendments that can enhance reclamation outcomes. This study will expand in 2025 to encompass all our mine sites, including initiating a trial to utilize hog waste to improve organic content.

At Quintette Mine, our commitment includes a high-elevation plant salvage program for the legacy pits. This program features a feasibility study assessing the long-term ecological potential of transplanting recovered vegetation from active mining areas to legacy sites. A trial is planned for 2025 to explore this opportunity to enhance biodiversity within our reclaimed landscapes.

The successful submission of the Wolverine Mine Closure Plan to MCM on December 31st was critical for our reclamation planning efforts. Simultaneously, the ongoing metals uptake monitoring program at Brule and Willow Creek Mines provides critical insights that inform our adaptive management strategies, ensuring a comprehensive and practical approach to reclamation.

At Willow Creek Mine, we are prioritizing the integration of ecological and cultural values through our eco-cultural monitoring program. This initiative fosters meaningful collaboration with Indigenous communities, ensuring that traditional knowledge guides our reclamation efforts and supports the preservation of culturally significant landscapes.

Social

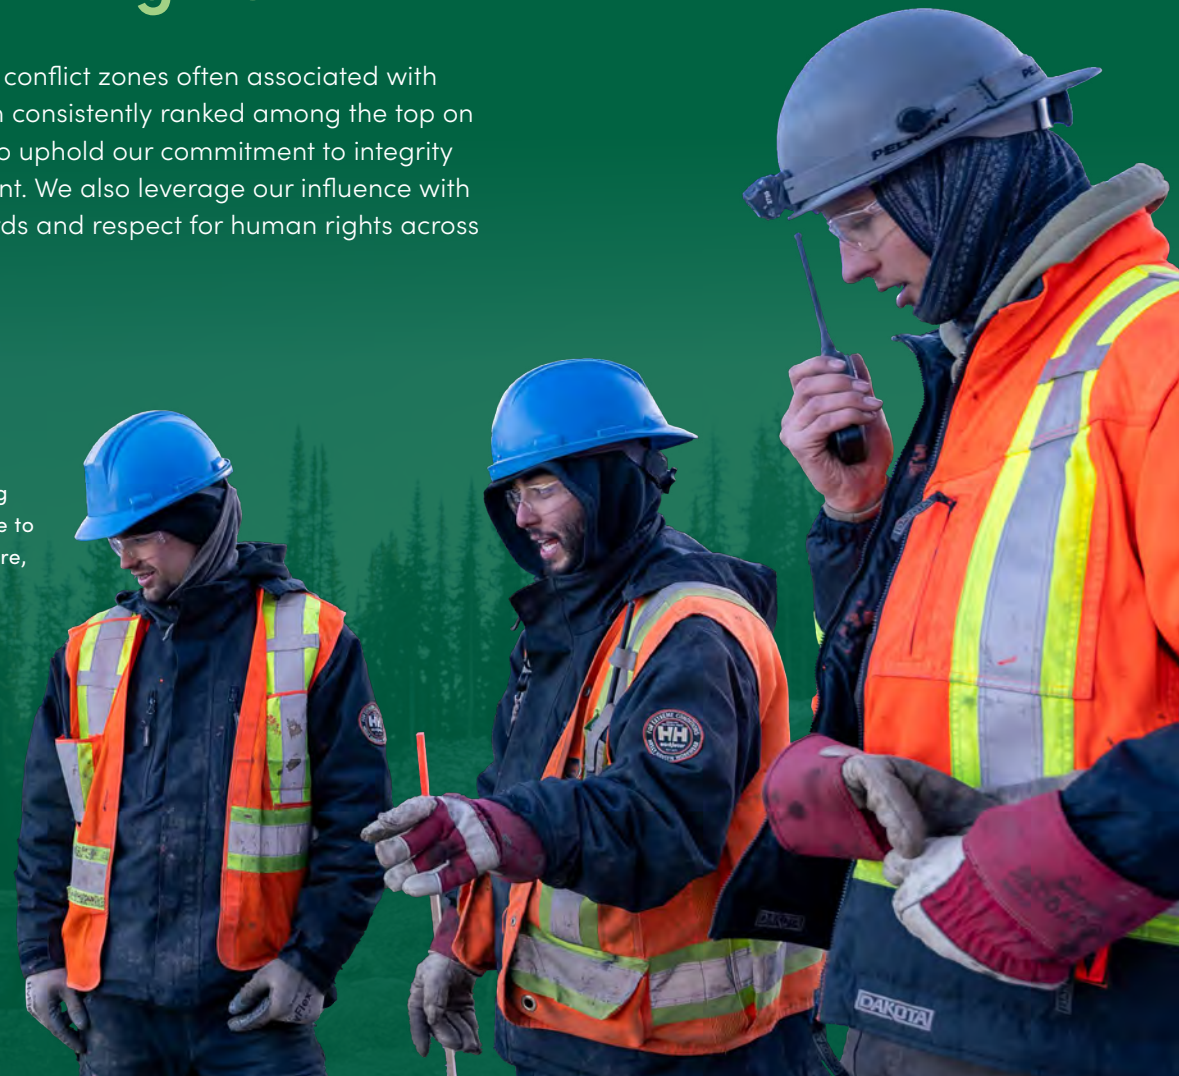

Labour Relations and Human Rights

Our operations are based entirely within Canada, far removed from conflict zones often associated with military conflict, violence, or political instability. Operating in a nation consistently ranked among the top on Transparency International’s Corruption Perception Index allows us to uphold our commitment to integrity and ethical business practices within a stable and secure environment. We also leverage our influence with suppliers in higher-risk areas to ensure adherence to ethical standards and respect for human rights across our supply chain.

Rooted in our proud heritage in NEBC, we actively support local communities in fostering growth and vibrant societies. Our ever-deepening involvement spans community investment, engagement, education, and donations, reflecting our dedication to making a meaningful and lasting difference.

We prioritize human rights in all employment-related decisions, strictly prohibiting unlawful discrimination and promoting equal employment opportunities. We strive to align our practices with a shared vision for a more sustainable and equitable future, ensuring our initiatives contribute to a positive global impact.

AT A GLANCE

Advancing Reconciliation: Embedding Call to Action #92 into our business practices.

Cultural Connections: Participated in community events, including Saulteau First Nation's Cultural Centre opening, Pemmican Days, West Moberly Days, McLeod Lake Indian Band's AGM and Kelly Lake Days.

Economic Impact: Indigenous business spending more than doubled in 2024, reaching \$188M, of which \$141M was in capital expenditures.

Capacity Building: Collaborated to create employment opportunities and enhance business capacity.

Caribou Restoration Support: Collaborated with local Indigenous Nations to protect and restore caribou habitat to boost population recovery.

Relationships with Indigenous Nations

We operate exclusively within Treaty 8 Territory, recognizing and respecting the impact our operations and projects have on Indigenous Nations' traditional territories. We are deeply committed to fostering and strengthening relationships with Indigenous Nations through meaningful engagement, collaboration, and reconciliation.

In alignment with **Call to Action #92 of Canada's Truth and Reconciliation Commission**, we aspire to integrate reconciliation into our business by:

- Establishing respectful and equitable partnerships with Indigenous Nations from the earliest stages of project development through to closure.
- Supporting economic reconciliation by creating opportunities for Indigenous Nations' businesses, affiliates, and individuals, including skills development, employment, and capacity-building initiatives.

Our approach ensures that reconciliation is a commitment and a foundation for creating mutual benefits and lasting positive change throughout the mine's life. We were honoured to be invited to the opening of the Saulteau First Nation Cultural and Recreation Centre and Pemmican Days, both in July 2024, West Moberly Days, also held in July 2024, and the McLeod Lake Indian Band Annual General Assembly and Kelly Lake Days in August 2024. These events provide invaluable opportunities for our leadership and employees to learn, connect, and deepen our understanding of Indigenous cultures and traditions.

In 2024, we continued to engage comprehensively with local Indigenous Nations, in relation to Quintette Mine, water management and treatment at Brule Mine, environmental monitoring, and caribou conservation. We remain committed to maintaining consistent, open dialogue throughout the life cycle of our mines.

CEO Brian Sullivan and Chief Norman Calliou of Kelly Lake at the October 2024 ceremony at Kelly Lake Community Center, commemorating the new agreement and strengthening relationships with Kelly Lake, McLeod Lake Indian Band, and Duz Cho

In 2024, spending with Indigenous Nations' businesses and affiliates more than doubled again, driven by our significant capital investments, reaching \$188 million. This milestone highlights our steadfast commitment to generating value for Indigenous Nations while showcasing their companies' expanding capacity and expertise. Local Indigenous Nations aim to build capacity and create employment opportunities for their members. In this regard, we collaborate to realize business opportunities that, in turn, generate jobs for Indigenous peoples.

As part of the Quintette Mine Restart, we were honoured to collaborate with Saluteau First Nations and West Moberly First Nations on caribou conservation and recovery. In partnership, large tracts of land will be protected from coal exploration and development; financial contribution directed to habitat restoration and population recovery efforts that are led by Indigenous Nations, as well as enhanced wildlife, restoration and reclamation monitoring and involvement in Conuma's reclamation.

Jordan Demeulemeester showcasing the rich cultural heritage of Sauteau First Nations at Pemmican Days in July 2024

AT A GLANCE

Economic Impact: Spent \$237M locally, supporting businesses in Tumbler Ridge, Chetwynd, Dawson Creek, and Fort St. John.

Local Employment: Over 70% of employees live in NEBC, boosting regional economic resilience.

Community Engagement: Supported events and initiatives across NEBC and Indigenous Nations, fostering connections and cultural appreciation.

Education Support: Awarded 16 scholarships to students in mining, trades, healthcare, and education fields.

Volunteer Partnerships: Collaborated with not-for-profits to enhance community well-being.

Emperor's Challenge: Supported BC's largest off-road race, ensuring safe operations through Quintette Mine terrain.

Community Relationships

All our operations are located in NEBC, a region rich in resource development. Tumbler Ridge was established in the early 1980s to support the development of the area's steelmaking coal mines, with Quintette Mine as its largest employer. The town faced significant economic challenges when Quintette Mine was placed into care and maintenance in 2001. Since Conuma began operating in the District of Tumbler Ridge in 2016, our presence as a stable, large local employer has brought renewed economic stability to residents and businesses. Today, over 70% of our employees live in NEBC.

In February 2023, we acquired Quintette Mine and promptly launched a significant capital program to restart operations. After receiving its mining permit on September 4, 2024, the mine produced its first steelmaking coal the next day, followed by the departure of its first train on September 18, 2024—the first train from Quintette Mine in 24 years. The mine's reopening was celebrated widely by the local community, serving as a defining milestone for our workforce and the town of Tumbler Ridge. With extensive proven reserves and resources, the reopening of the Quintette Mine represents a key milestone in our strategic expansion, contributing to long-term economic resilience.

The nearby communities of Chetwynd and Mackenzie also benefit from natural resource industries, including our mines. Cities such as Dawson Creek and Fort St. John support and share in the economic activity generated by resource development and our operations. In 2024, our commitment to local employment and procurement contributed significantly to NEBC's economy, with \$237 million spent with vendors from these centres. Our procurement teams work closely with local businesses and contractors to secure a wide range of supplies, equipment, and services necessary for our operations. These efforts help contribute to the economies of the communities in which we work.

In rural communities, not-for-profit organizations and their volunteers donate countless hours to enhance the social fabric of these communities. We are honoured to support local organizations and initiatives to complement the work of volunteers. In 2024, we supported and participated in multiple community events in Tumbler Ridge, Chetwynd, Mackenzie, McLeod Lake, Saulteau First Nations, West Moberly First Nations, Kelly Lake, and Halfway River First Nation. We continue to look for opportunities to partner and support local organizations and initiatives.

As part of our commitment to supporting education and empowering youth to pursue post-secondary studies and skill development, we awarded scholarships to five students in 2024. These were all in mining-related fields such as engineering, environmental management, and trades.

Recognizing the vital role of education, healthcare, and social services in the sustainability of NEBC communities, we also provided 11 scholarships to students pursuing careers in these essential sectors.

We were proud to again support the annual “Emperor’s Challenge” in August 2024. It is one of BC’s largest off-road running events. As the 20-kilometre race route crossed a section of Quintette Mine, we collaborated closely with the organizing committee and site staff to ensure it was conducted safely and successfully.

CONUMA CUP: FOSTERING TEAM SPIRIT AND COMMUNITY SUPPORT

The 2024 Conuma Cup brought employees together for an exciting hockey tournament, showcasing teamwork and friendly competition. More than just a game, the event supported local food banks, reinforcing our commitment to community.

REGIONAL EXPENDITURE

	2022			2023			2024		
	OPERATING COSTS	CAPITAL EXPENDITURE	TOTAL	OPERATING COSTS	CAPITAL EXPENDITURE	TOTAL	OPERATING COSTS	CAPITAL EXPENDITURE	TOTAL

Total	134	23	156	146	26	172	114	123	237

BEAR AWARE TRAINING: PROMOTING SAFETY AND CONSERVATION

In 2024, we trained over 140 participants across our communities, including Chetwynd, Mackenzie, Tumbler Ridge, and Dawson Creek, in wildlife awareness, equipping them with essential skills to navigate bear country safely. These sessions enhanced safety and supported conservation efforts in communities.

PROJECT K.A.R.T.S: A RESOUNDING SUCCESS AT TUMBLER RIDGE SECONDARY

The return of the Tumbler Ridge Secondary School Go-Karts program in 2024, rebranded as Project K.A.R.T.S., was a tremendous success, thanks to the hard work and dedication of the students, teachers, and community partners. Led by senior students with guidance from Conuma and other mentors, the project emphasized teamwork, strategic planning, and innovation. Students took full ownership, creating team names and logos and securing 24 sponsors through impressive outreach efforts. With hands-on welding instruction and support from local stakeholders, they brought their vision to life in time for an exciting race day on Friday, May 31. The event saw strong community support, enthusiastic participation, and excellent competition, highlighting the power of collaboration and skill development within Tumbler Ridge.

AT A GLANCE

Employee Events: Barbecues, Christmas parties, and community events like “Sleddin’ Santa”.

Training Focus: 30,000+ in-person training hours, revamped standard operating procedures, and 7 new Red Seal certifications.

Wellness Support: Launched Sparrow enhancing mental health, financial, and legal resources.

Diversity Growth: Women in management rose to 37%; Indigenous representation reached 7%.

Retention Success: Reduced turnover by 15% through stronger engagement and support.

Employee Ideas: Implemented 2,200+ suggestions via “Protecting Our House”.

Employee Relations

Employee Events

Every year, we organize several engaging events for our employees and their families that align with their work schedules and actively engage local businesses and community groups. During the summer, we hosted barbecues for employees and their families, providing a relaxed setting to strengthen connections and enjoy the warm weather. To celebrate the 2024 holiday season, we hosted two Employee Christmas Parties and two Children's Christmas Parties, ensuring everyone could join the festivities. We also partnered with Tumbler Ridge Geo Park for the annual “Sleddin’ Santa” event, bringing families together for holiday cheer. In appreciation of our communities' support, we organized a family swim and skate weekend in Mackenzie and a swim day in Chetwynd.

Employee Engagement

Our success as a business depends on having engaged employees. They are more productive, work safely, uphold our core values, and remain with us longer. Effective communication is key to fostering this engagement, ensuring employees feel valued and recognized as essential contributors to our success. While most communication happens directly through managers and supervisors, we have made significant efforts to strengthen communication and leadership skills among our frontline leaders through comprehensive in-person and online training programs.

As part of these engagement efforts, in 2024, we expanded the Conuma newsletter, which continues to be well-received across the organization. It is a valuable platform to share Company updates, operational achievements, success stories, and upcoming Company and community events. Building on this success, in September 2024, we introduced the “Days Off Family & Community Bulletin,” an extension of the newsletter to strengthen connections between employees, their families, and the communities we serve. This bulletin has become an effective resource for sharing local events, highlighting not-for-profit organizations, and promoting businesses that support our workforce. Employees have actively contributed by submitting events, sharing volunteer experiences, and offering suggestions to enhance its impact.

Employee Training and Development

In 2024, we made further strides in enhancing safety and operational efficiency by developing and revising comprehensive Standard Operating Procedures (SOPs) and policies. A total of 44 SOPs were created or updated, covering critical areas such as excavator operation, blasting quality control, and work zone safety barriers. Additionally, policies related to energy isolation, personal protective equipment, and vehicle usage were revised to align with evolving industry standards and regulatory requirements. These updates ensure our workforce is equipped with the latest best practices, reinforcing our commitment to maintaining a safe and compliant work environment.

To support the successful implementation of these policies and procedures, we expanded our training programs, introducing new courses and enhancing existing programs. Key developments included the rollout of pit driving training, the creation of a new platform for centralized document control, and the transitioning of all SOPs and policies to the OneSource platform for easier accessibility. Furthermore, instructor training was provided in crucial areas such as forklift operation, fall protection, and confined space entry, strengthening the skillset of our workforce. Introducing inspection books for critical equipment, including man lifts and forklifts, further reinforces our focus on proactive safety measures and operational excellence.

Our Apprenticeship Program remains a cornerstone of workforce development, with 15 employees currently enrolled in the Heavy-Duty Mechanic (HDM) program. In 2024, two apprentices passed the Interprovincial Red

Seal Exam, and five foreign workers received their Red Seal certification. With consistently high performance across all apprenticeship levels—averaging over 85%—we are well-positioned to expand the program in 2025. A total of 56 candidates applied for the upcoming cohort, with plans to award positions at our Quintette and Willow sites, further strengthening our skilled labour force. In all, during 2024, our employees completed over 30,000 hours of in-person training and over 13,000 hours of e-learning, reflecting our ongoing investment in skills development.

To further enhance our internal capabilities, we introduced two key dedicated training roles to strengthen collaboration between our Health and Safety and Training departments. These positions have been instrumental in increasing internal capacity and flexibility while reducing reliance on external trainers. By developing in-house expertise, we ensure that our employees receive consistent, high-quality training that aligns with our operational goals and safety standards.

Employee Assistance Program

In July 2024, we increased our commitment to employee well-being and resiliency by upgrading our Employee and Family Assistance Program with the introduction of Sparrow. This new program provides expanded access to confidential counselling, legal and financial advice, and health coaching to better support our employees and their families. The program is tailored to individual needs, and over 5,000 therapists are available virtually, by phone, or in person. Some enhancements included Digital Cognitive Behavioral Therapy to support mental health and a 24/7 crisis line, ensuring immediate support.

INTRODUCING THE HR KNOWLEDGE CENTRE: EMPOWERING EFFICIENCY & CONSISTENCY

In 2024, the Human Resources (HR) Knowledge Centre was launched. It's a game-changing resource hub designed to streamline HR processes and support the entire organization. This centralized platform brings together key functions such as recruiting, onboarding, payroll, and leave management, ensuring HR teams have quick access to up-to-date policies, workflow guides, and best practices. By cutting down search time and promoting consistency, the Knowledge Centre is empowering our HR professionals to provide faster, more effective support to employees and supervisors.

Respectful Workplace

We are dedicated to cultivating a culture of respect across our organization, recognizing it as the foundation of a safe and productive workplace. Each employee plays a vital role in fostering an environment where everyone feels valued, heard, and supported in a spirit of collaboration.

To uphold this commitment, employees are encouraged to:

- Approach colleagues with openness and appreciation for their ideas, contributions, and feelings.
- Practice active listening and show genuine interest in diverse perspectives.
- Embrace a mindset of continuous learning, viewing challenges as opportunities for growth.
- Communicate with professionalism and appropriate language in all interactions.
- Address conflicts constructively, focusing on solutions rather than personal criticism.
- Be mindful of personal space and boundaries to promote a comfortable and inclusive atmosphere.
- Demonstrate reliability and respect for colleagues' time by being punctual and dependable.
- Offer and receive feedback with a focus on improvement and mutual respect.
- Recognize and celebrate the achievements of others, fostering a positive and supportive workplace.
- Maintain confidentiality and handle sensitive information with care and integrity.

By embracing these principles, we create a workplace where respect is encouraged and lived every day.

One Conuma Strong

At Conuma, diversity strengthens our organization and promotes a welcoming workplace for employees, stakeholders, and Indigenous partners. We are “One Conuma Strong” – committed to ensuring everyone feels valued, respected, and empowered.

Our culture is built on principles of:

- Treating everyone with kindness and respect, regardless of background or identity.
- Embracing diversity in all forms, including age, gender, ethnicity, abilities, and culture.
- Providing equal access to opportunities, training, and career advancement based on merit.
- Maintaining a zero-tolerance policy for discrimination, bullying, and harassment.
- Addressing biases to create fair processes and systems.
- Encouraging diverse perspectives at all levels, including leadership.

We continue to build a workplace where diversity is a strength and every individual can thrive.

In 2024, we expanded our Women’s Employee Resource Group meetings, initially launched in 2023, to all our operating sites. Over the year, we held 26 meetings, providing a dedicated forum for our female employees to connect, share experiences, and receive support.

In 2024, the representation of women in our management team increased by 8%, rising from 29% in 2023 to 37%. The proportion of women remained at 24%, consistent with the previous year. Additionally, the percentage of individuals self-identifying as members of Indigenous Nations grew to 7%, compared with 6% in 2023. Our commitment to hiring locally remains strong, with over 80% of our workforce residing in BC. As part of our ongoing commitment to employee engagement and retention, we achieved a further 15% reduction in our annual employee turnover rate compared with 2023.

In May 2024, we relaunched our “Protecting Our House” employee suggestion program with a renewed focus on gathering ideas for workplace improvements, particularly safety. Our goal was to establish a system that captures practical and actionable suggestions from employees. In the seven months since relaunching the program, we have received more than 2,900 submissions, with more than 2,200 successfully implemented and an additional 700 in progress by year-end.

Business Ethics and Code of Conduct

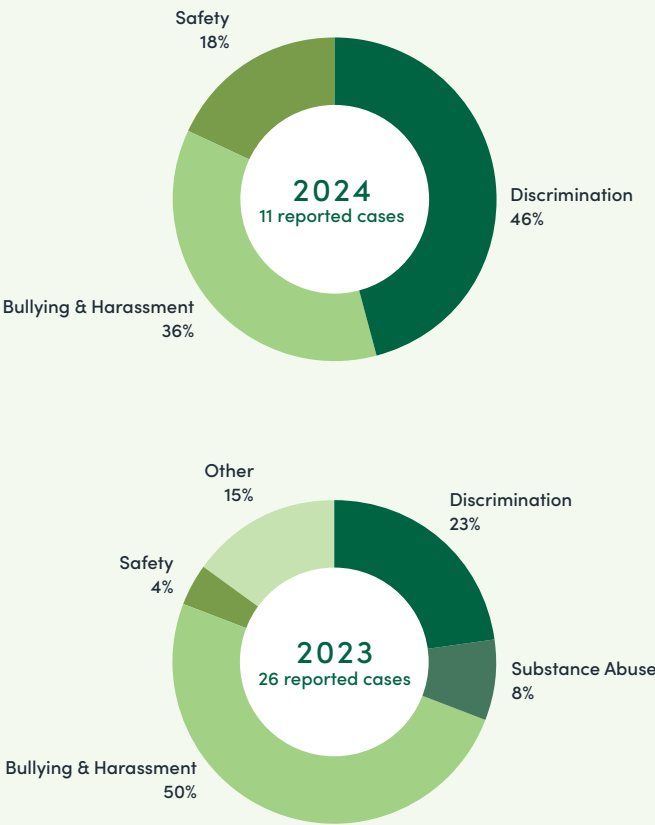

To achieve our mission, we rely on an engaged and skilled workforce that upholds ethical behaviour aligned with our Company Values and Code of Conduct. This is critical for maintaining our social licence to operate. As representatives of our organization, employees are expected to act with honesty, integrity, and fairness, safeguarding and enhancing our reputation.

Our Business Ethics and Code of Conduct Policy reinforces our commitment to conducting business ethically, morally, and legally. It provides a clear framework for meeting and upholding our ethical and compliance standards, including anti-corruption measures. The policy defines acceptable workplace behaviour and business practices, sets expectations for how we work, and helps us proactively identify and address ethical or compliance issues.

Employees interacting with vendors, regulators, or other stakeholders, must complete additional anti-corruption training through our Learning Management System program. We also provide a whistleblower service managed externally through NAVEX Global EthicsPoint, offering anonymous reporting options via phone, website, email, or mail.

In 2024, the number of reported alleged violations decreased to 11, less than half of the 26 cases received in 2023. All reports were thoroughly investigated and appropriately resolved. The chart below illustrates the breakdown of business conduct cases reported through EthicsPoint from 2023 to 2024.

REPORT TYPES

Cyber-Security and Artificial Intelligence

In response to the rapid evolution and increasing complexity of cyber threats—particularly those targeting the resource sector—we have proactively upgraded our technology infrastructure and data centers to the latest advancements. We continuously enhance our security measures to safeguard our infrastructure and organizational data and ensure a secure work environment. Our cybersecurity position is being strengthened by integrating Artificial Intelligence (AI)-driven automation within our internal systems and processes.

As part of our ongoing digital and operational transformation, we have adopted a Zero Trust Network Architecture (ZTNA) and implemented industry-leading, accredited tools to evolve into a risk-based organization. To drive our cybersecurity initiatives and technological innovation, we have appointed an Information Security Manager within our Technology group, ensuring a dedicated focus on these critical areas.

We are committed to maintaining a comprehensive cybersecurity strategy that aligns with our organizational culture, mission, and vision. This strategy ensures that all systems, networks, and data remain secure from unauthorized access. Regular threat and vulnerability assessments are conducted, with identified risks being addressed through appropriate remediation actions.

To cultivate a cyber-aware culture, we will introduce a cybersecurity awareness program for employees in 2025. Additionally, we maintain a robust incident response plan to minimize service disruptions and data loss in the event of an attack. Our commitment to compliance includes adherence to global regulations, recognized standards such as ISO 27001 for information security management systems, and industry best practices. Our technology roadmap also outlines key initiatives to fortify our security and address emerging threats so we can proactively apply advanced tools for protection and maintenance.

IT Security: 2024 Key Milestones

1. External Threat Assessment:

- In September 2024, we conducted a comprehensive threat assessment with an external partner. Following the assessment, our technology team implemented additional remediation measures documented in a risk register to guide countermeasures planned for 2025.

2. Multi-Factor Authentication (MFA) Compliance:

- As of 2024, mandatory MFA has been implemented for all new employees to strengthen access controls.

3. IT and Operating Technology Segmentation:

- Quintette Mine: We completed both logical and physical separations in 2024.
- Willow Mine: We completed logical separation in 2024, and physical separation is planned for 2025.
